Supporting Information

CO₂ selective 1D double chain dipyridyl-porphyrin based porous coordination polymers

Hyun-Chul Kim, Young Sun Lee, Seong Huh,* Suk Joong Lee,* and Youngmee Kim*

Fig. S1 Formula unit of II with atomic labelling scheme. Displacement ellipsoids are shown at the 50% probability level. DMF and water solvent molecules and all hydrogen atoms were omitted for clarity. Symmetry operations: (i) 1-x, 2-y, 1-z, (ii) x, 1+y, z, (iii) 1-x, 1-y, 1-z, and (iv) x, -1+y, z.
Fig. S2 (a) 1D double chain structure of II. All DMF and water solvent molecules were omitted for clarity. (b) Hydrogen bonds between 1D double chains are shown as green dotted lines. Two 1D double chain coordination polymers are shown as different colors for clarity.
Fig. S3 Space-filling model of four selected 1D double chains for II with different colors viewed down the $b$-axis, indicating efficient packing of each chain.
Fig. S4 Isosurface of the channels for solvent-free II along the $a$-axis (a) and $b$-axis (b). Grey and green colors indicate the exterior and interior of the isosurface, respectively.
Fig. S5 TG profiles for I (a, b) and II (c, d). The TG profiles of the activated samples are plotted together with those of as-prepared samples in b and d.
Table S1. ICP data of $\text{Co}_3(\text{DPP})_3\cdot\text{4DMF}$ (l).
