**General Considerations.** All manipulations were carried out in either an Innovative Technology Inc. inert atmosphere glovebox or on a greaseless dual manifold vacuum line using Teflon (Kontes) needle valves and swivel-frit type glassware. Tetrahydrofuran, toluene and hexanes were dried using a Grubbs/Dow solvent purification system and stored in evacuated thick glass vessels over sodium/benzophenone prior to use. Dichloromethane was dried over CaH2, evacuated and transferred into a thick glass vessel over activated 4Å molecular sieves prior to use. Toluene-d8, benzene-d6 and THF-d8 were purchased from Aldrich, dried over sodium/benzophenone and vacuum transferred into sealed thick glass vessels prior to use. Proligands (C6H4PPr2)2CH2 and (C6H4PBu3)2CH2, and complex (C6H4PPr2)2CHNiOH (2PPr) were prepared according to published procedures.1-2 All other reagents were purchased from Aldrich and used as received. NMR spectra were obtained on Bruker Avance III 400 MHz and 600 MHz spectrometers. Elemental analyses were obtained by the Instrumentation Facility of the Department of Chemistry on a Perkin-Elmer CHNS/O series II analyzer 2400. X-ray crystallographic analyses were performed on a Nonius KappaCCD diffractometer with samples coated in Paratone 8277 oil (Exxon) and mounted on a glass fibre. Full crystallography details can be found in independently uploaded (.cif) files.

**Synthesis of di-cyclohexylphosphino substituted proligand.**

To a flask charged with bis-(2-bromophenyl)methane (1.02g, 3.13 mmol), 60 mL of diethyl ether was added via vac transfer. The solution was cooled to -78 °C and tert-butyllithium (1.7 M in pentane, 7.36 mL, 12.5 mmol) was added drop-wise over 15 minutes. The mixture was left to stir for 3 hours while holding the temperature constant. Di-cyclohexylchlorophosphine (1.38 mL, 6.25 mmol) was then added quickly, and the solution was allowed to warm to room temperature with stirring overnight. The solution was filtered, and the solvent removed in vacuo. Acetonitrile (20 mL) and the crude product was triturated. The resulting solution was left at room temperature (2 hours) to recrystallize, then filtered. Colorless crystals were washed 3 times with acetonitrile. 1.635 g (2.92 mmol) of product was isolated (93% yield). 1H NMR (600 MHz, C6D6): δ 7.48 (dt, 3JHH = 7.4, 3JHP = 2.4 Hz, 2H, ArH), 7.18 (m, 2H, ArH), 7.10 (m, 4H, ArH), 5.27 (t, 4JHP = 3.2 Hz, 2H, CH2), 2.02 (m, 4H, CH2, Cy), 1.96 (m, 4H, CH2, Cy), 1.72 (dt, 3JHH = 11.2, 3JHP = 3.5, 3JHP = 1.9 Hz, 8H, CH2, Cy), 1.63 (m, 5H, CH2, Cy), 1.56 (m, 5H, CH2, Cy), 1.21 (m, 18H, CH2, Cy). 31P{1H} NMR (243 MHz, C6D6): δ -15 (s). 1H NMR (600 MHz, THF): δ 7.53 – 7.44 (m, 2H), 7.22 – 7.05 (m, 4H), 6.98 – 6.86 (m, 2H), 4.80 (t, J = 3.2 Hz, 2H), 1.94 (tdd, J = 13.7, 8.8, 3.9 Hz, 4H), 1.84 – 1.69 (m, 6H), 1.71 – 1.54 (m, 6H), 1.44 – 0.98 (m, 28H). 13C{1H} NMR (151 MHz, THF): δ 150.1 (d, 1JCP = 27.1 Hz, aryl CP), 135.3 (d, 2JCP = 20.1 Hz, aryl C), 133.6 (d, 3JCP = 2.9 Hz, aryl C), 131.4 (d, 4JCP = 5.0 Hz, aryl C), 129.2 (s, aryl C), 126.1 (s, aryl C), 39.7 (t, 3JCP = 26.3 Hz, CH2), 35.2 (d, 1JCP = 14.6 Hz, C, Cy), 31.7 (d, 2JCP = 17.7 Hz, C, Cy), 30.4 (d, 3JCP = 9.1 Hz, C, Cy), 28.3 (d, 2JCP = 12.0 Hz, C, Cy), 28.1 (d, 3JCP = 7.6 Hz, C, Cy), 27.6 (s, C, Cy). 31P{1H} NMR (243 MHz, THF): δ -15 (s). **Synthesis of (C6H4PPr2)2CHNiBr, 1PPr.**

An improved synthesis than that previously reported was employed.1 To a solid mixture of anhydrous NiBr2 (0.546 g, 2.5 mmol) and the ligand precursor (C6H4PPr2)2CH2 (1PPr) (1.0 g, 2.5 mmol) was added dichloromethane (50 mL) and triethylamine (0.71 mL, 5.1 mmol). The reaction mixture was stirred at room temperature for 1 day. The resulting brown solution was evacuated and the residue dissolved in toluene and filtered. The filtrate was concentrated to 3 mL. Hexanes were layerd over the
toluene solution. The solution was stored at -30 °C for 2 days yielding large brown crystals of the product. The crystals were separated and dried under vacuum. Yield 1.25 g (93%). Spectroscopic data consistent with that previously reported was obtained.  

**Synthesis of (C₅H₅PBU'₂)₂CHNiCl, 1^{Bu}**

To a solid mixture of anhydrous NiCl₂ (0.143 g, 1.1 mmol) and the ligand precursor (C₅H₅PBU'₂)₂CH₂ (1^{Bu}) (0.500 g, 1.1 mmol) was added dichloromethane (30 mL) and triethylamine (0.32 mL, 2.3 mmol). The reaction mixture was stirred at room temperature for 1 day. The resulting brown solution was evacuated and the residue dissolved in toluene and filtered. The filtrate was concentrated to 1 mL and the solution was slowly evaporated at -30 °C for 2 days yielding large brown crystals of the product. The crystals were separated and dried under vacuum. Yield 0.550 g (91%).

**Synthesis of (C₅H₅PCy₂)₂CHNiBr, 1^{Cy}**

To a solid mixture of anhydrous NiBr₂ (0.117 g, 0.54 mmol) and the ligand precursor (C₅H₅PCy₂)₂CH₂ (1^{Cy}) (0.300 g, 0.54 mmol) was added dichloromethane (50 mL) and triethylamine (0.15 mL, 1.09 mmol). The reaction mixture was stirred at room temperature for 1 day. The resulting dark orange solution was evacuated and the residue dissolved in toluene (5 mL) and filtered. Hexanes (5 mL) were layered over the toluene solution. The solution was stored at -30 °C for 2 days yielding small orange crystals of the product. The crystals were separated and dried under vacuum. Yield 0.340 g (90%).

**Synthesis of (C₅H₅PBU'₂)₂CHNi(OH), 2^{Bu}**

To a solution of 2^{Bu} (0.150 g, 0.27 mmol) in a mixture of THF (15 mL) and H₂O (0.2 mL) was added an excess of CsOH (0.200 g). The reaction mixture was sonicated at room temperature for 24 h. The reaction was monitored via 31P{¹H} NMR spectroscopy to ensure complete conversion had taken place prior to workup. The brown solution was filtered, and the filtrate was evaporated under vacuum. The residue was extracted with hexanes and concentrated to 0.5 mL under vacuum. Amorphous brown
crystals of the product were obtained after 2 days at -30°C. The crystals were separated by decantation and dried under vacuum. Yield 0.120 g (84%).

**Synthesis of 3^{Pr}•NH_2C(O)Ph under catalytic conditions**

To a solution of PhCN (0.010 mL, 0.097 mmol) and (PCP-Pr)^3NiOH (5 mg, 0.010 mmol) in THF (0.6 mL) was added H_2O (0.010 mL, 0.55 mmol). The reaction mixture was stored for 1 day at room temperature. Color change from orange to yellow was observed. The reaction mixture was evaporated and dried under vacuum. The residue was extracted with hexanes. The hexanes fractions were combined and concentrated under vacuum. A few yellow crystals (~2-3 mg) were obtained overnight at -30°C, which were separated from the solution by decantation and analyzed by X-ray crystallography.

**Synthesis of (C_4H_8PPP)^3CHNiOC(O)CH_3, 4^{Pr}**

To a solution of 2^{Pr} (20 mg, 0.04 mmol) in EtOH (0.6 mL) was added KOC(O)CH_3 (73 mg, 0.75 mmol). The reaction mixture was stirred for 1 h at room temperature and evaporated under vacuum. The residue was extracted with toluene and concentrated under vacuum. Hexanes were layers over the toluene solution. Brown crystals of the title product were obtained after 3 days at -30°C. Yield 20 mg (97%).

**Synthesis of (C_4H_8PPP)^3CHNiCN, 5^{Pr}**

To a solution of 3^{Pr} (20 mg) in THF (0.6 mL) was added (CH_3)_2C(OH)(CN) (30 μL). Full conversion into (C_4H_8PPP)^3CHNiCN 5^{Pr} was observed by NMR spectroscopy. The solvent was evacuated and the residue dried under vacuum for 3h at 60°C. The dry solids were dissolved in toluene (2 mL) and layered with hexanes (1 mL). Yellow crystals of the title complex were obtained after 24h at -30°C. The crystals were separated by decantation and dried under vacuum. Yield 14 mg (68%).

Catalytic Hydration of Nitriles to Amides

A typical small scale nitrile hydration was carried out as follows. Nitrile (0.2 mmol), H$_2$O:iPrOH 1:1 (0.5 mL) and catalyst (0.1-0.5 mol%) were placed in a J. Young NMR tube and heated inside the NMR spectrometer at the desired temperature. The progress of the reaction was monitored via $^1$H NMR spectroscopy.

A typical large scale nitrile hydration was carried out as follows. Nitrile (2 mmol), H$_2$O:iPrOH 1:1 (10 mL) and catalyst (0.05-0.5 mol%) were placed in a thick walled vessel and heated in an oil bath at 80 °C. The progress of the reaction was monitored via $^1$H NMR spectroscopy of quenched aliquots. Once the reaction was deemed complete, all the volatiles were removed under vacuum. The resulting solids were washed with hexane (3 x 20 mL) and dried under vacuum to yield the desired product amide.
