Experimental Section

Reagents. The reagents (including glucose, HAuCl₄·3H₂O, CeCl₃·7H₂O and urea) used were all analytical grade (A.R.) in purity, and bought from Beijing chemical reagent factory and Sinopharm Chemical Reagent Co., Ltd.

Synthesis of Au@CeO₂ submicrospheres: In a typical procedure, 3.75 g of glucose was dissolved in 60 mL of deionized water to form a clear solution. 1.8 mL of HAuCl₄ aqueous solution (10 mM) was added drop by drop into the above-mentioned solution under vigorous stirring for 15 min, and the mixture was named as solution A. 0.88 g of urea was dissolved in 34.8 mL of deionized water to form a clear solution, and 0.7 g of CeCl₃·7H₂O was added to above solution. The resulting mixture was kept for 15 min under stirring, and the mixture was named as solution B. Subsequently, the solution B was added drop by drop into the solution A under vigorous stirring for 15 min to form a clear yellow solution. Then, the yellow solution was transferred and sealed in the Teflon-sealed stainless steel autoclave. The autoclave was kept at 160 °C for 20 h. When the reaction was completed, the formed suspensions were usually deeply brown in color. A rinsing process including three cycles of washing procedure with deionized water was required before oven drying at 100 °C for 12 h. Finally, the solid powder was calcined in a muffle furnace under air atmosphere at 600 °C for 6 h.

Synthesis of CeO₂ submicrospheres: In a typical procedure, 3.75 g of glucose was dissolved in 60 mL of deionized water to form a clear solution A. 0.88 g of urea was dissolved in 34.8 mL of
deionized water to form a clear solution, and 0.7 g of CeCl₃·7H₂O was added to above solution. The resulting mixture was kept for 15 min under stirring, and the mixture was named as solution B. Subsequently, the solution B was added drop by drop into the solution A under vigorous stirring for 15 min to form a clear solution. Then, the solution was transferred and sealed in the Teflon-sealed stainless steel autoclave. The autoclave was kept at 160 °C for 20 h. When the reaction was completed, the formed suspensions were usually deeply brown in color. A rinsing process including three cycles of washing procedure with deionized water was required before oven drying at 100 °C for 12 h. Finally, the solid powder was calcined in a muffle furnace under air atmosphere at 600 °C for 6 h.

**Synthesis of the supported Au/CeO₂ submicrospheres:** An aqueous solution of HAuCl₄·3H₂O (10 mM, 10 mL) was added to deionized water (190 mL) and heated to the boiling point. A sodium citrate solution (38.8 mM, 20 mL) was then added, and the resulting mixture was kept for 30 min under stirring to form wine red solution. Subsequently, 1.85 g of CeO₂ submicrosphere powder was added to above wine red solution and stirred for 12 h. The final products were separated from the reaction solution by centrifuging at 8000 rpm for 15 min, and the solid powder was dried at 100 °C for 12 h.

**Synthesis of intermediate states of Au@CeO₂ submicrospheres at different reaction time:** In a typical procedure, 11.25 g of glucose was dissolved in 180 mL of deionized water to form a clear solution. 5.4 mL of HAuCl₄ aqueous solution (10 mM) was added drop by drop into the above-mentioned solution under vigorous stirring for 15 min, and the mixture was named as solution A. 2.64 g of urea was dissolved in 104.4 mL of deionized water to form a clear solution, and 2.1 g of CeCl₃·7H₂O was added to above solution. The resulting mixture was kept for 15 min under stirring, and the mixture was named as solution B. Subsequently, the solution B was added drop by drop into the solution A under vigorous stirring for 15 min to form a clear yellow solution. Then, the resulting mixture was divided into four equal parts and transferred to Teflon-lined stainless steel autoclaves, in which the samples were heated at 160 °C for 10 min, 1 h, 6 h, and 20 h, respectively. When the reactions were completed, the formed suspensions were collected with glass vials.

**Synthesis of Au@C submicrospheres:** In a typical procedure, 24 g of glucose was dissolved in 383 mL of deionized water to form a clear solution. 11.5 mL of HAuCl₄ aqueous solution (10 mM) was added drop by drop into the above-mentioned solution under vigorous stirring for 10 min. Then, the solution was transferred and sealed in the Teflon-sealed stainless steel autoclave. The autoclave was kept at 160 °C for 20 h. When the reaction was completed, the formed suspensions were usually deeply brown in color. The final products were separated from the reaction medium by filtering, and
the solid powder was dried at 100 °C for 12 h.

**Synthesis of Au@CeO₂ submicrospheres without adding glucose:** In a typical procedure, 1.8 mL of HAuCl₄ aqueous solution (10 mM) was added into 60 mL of deionized water to form a clear solution under vigorous stirring for 15 min, and the mixture was named as solution A. 0.88 g of urea was dissolved in 34.8 mL of deionized water to form a clear solution, and 0.7 g of CeCl₃·7H₂O was added to above solution. The resulting mixture was kept for 15 min under stirring, and the mixture was named as solution B. Subsequently, the solution B was added drop by drop into the solution A under vigorous stirring for 15 min to form a clear yellow solution. Then, the yellow solution was transferred and sealed in the Teflon-sealed stainless steel autoclave. The autoclave was kept at 160 °C for 20 h. When the reaction was completed, a rinsing process including three cycles of washing procedure with deionized water was required before oven drying at 100 °C for 12 h.

**Synthesis of CeO₂ submicrospheres without adding urea:** In a typical procedure, 3.75 g of glucose was dissolved in 60 mL of deionized water to form a clear solution A. 0.7 g of CeCl₃·7H₂O was dissolved in 34.8 mL of deionized water and was stirred for 15 min, and the mixture was named solution as B. Subsequently, the solution B was added drop by drop into the solution A under vigorous stirring for 15 min to form a clear solution. Then, the solution was transferred and sealed in the Teflon-sealed stainless steel autoclave. The autoclave was kept at 160 °C for 20 h. When the reaction was completed, the formed suspensions were usually deeply brown in color. A rinsing process including three cycles of washing procedure with deionized water was required before oven drying at 100 °C for 12 h. Finally, the solid powder was calcined in a muffle furnace under air atmosphere at 600 °C for 6 h.

**Synthesis of 0.5% Au@CeO₂ catalyst:** In a typical procedure, 3.75 g of glucose was dissolved in 60 mL of deionized water to form a clear solution. 0.9 mL of HAuCl₄ aqueous solution (10 mM) was added drop by drop into the above-mentioned solution under vigorous stirring for 15 min, and the mixture was named as solution A. 0.88 g of urea was dissolved in 34.8 mL of deionized water to form a clear solution, and 0.7 g of CeCl₃·7H₂O was added to above solution. The resulting mixture was kept for 15 min under stirring, and the mixture was named as solution B. Subsequently, the solution B was added drop by drop into the solution A under vigorous stirring for 15 min to form a clear yellow solution. Then, the yellow solution was transferred and sealed in the Teflon-sealed stainless steel autoclave. The autoclave was kept at 160 °C for 20 h. When the reaction was completed, the formed suspensions were usually deeply brown in color. A rinsing process including three cycles of washing procedure with deionized water was required before oven drying at 100 °C for 12 h. Finally, the solid powder was calcined in a muffle furnace under air atmosphere at 600 °C for 6 h.
Synthesis of 2% Au@CeO₂ catalyst: In a typical procedure, 3.75 g of glucose was dissolved in 60 mL of deionized water to form a clear solution. 3.6 mL of HAuCl₄ aqueous solution (10 mM) was added drop by drop into the above-mentioned solution under vigorous stirring for 15 min, and the mixture was named as solution A. 0.88 g of urea was dissolved in 34.8 mL of deionized water to form a clear solution, and 0.7 g of CeCl₃·7H₂O was added to above solution. The resulting mixture was kept for 15 min under stirring, and the mixture was named as solution B. Subsequently, the solution B was added drop by drop into the solution A under vigorous stirring for 15 min to form a clear yellow solution. Then, the yellow solution was transferred and sealed in the Teflon-sealed stainless steel autoclave. The autoclave was kept at 160 °C for 20 h. When the reaction was completed, the formed suspensions were usually deeply brown in color. A rinsing process including three cycles of washing procedure with deionized water was required before oven drying at 100 °C for 12 h. Finally, the solid powder was calcined in a muffle furnace under air atmosphere at 600 °C for 6 h.

Catalytic activity measurement for CO oxidation: All catalysts toward catalytic CO oxidation were evaluated using a fixed-bed stainless steel reactor coupled online with a gas chromatograph (GC-2014C, SHIMADZU), a molecular sieve column, and a thermal conductivity detector (TCD). The operation conditions were shown as follows: 200 mg of sieved catalyst (40-60 meshes), a gas mixture of 1% CO, 1.6% O₂ and 97.4% He (balance gas) with a total flow rate of 50 mL·min⁻¹ corresponding to a space velocity of 15,000 mL·h⁻¹·g⁻¹_cat, programmed-temperature rate at 0.75 °C·min⁻¹.

Characterization: Powder XRD patterns were recorded on a Panalytical X’Pert-pro MPD X-ray power diffractometer, using Cu Kα radiation (λ = 1.54056 Å). SEM was performed on a Hitachi S-4800 electron microscope. TEM were performed on FEI Tecnai G² F20 electron microscope operated at 200 kV with the software package for automated electron tomography. FTIR spectra (PE2000) were acquired to identify the structural vibration and surface functional groups of samples. The BET (Brunauer-Emmett-Teller) surface area, pore volume and pore size of catalysts were measured using a Quasarorb SI-MP instrument. Prior to each measurement, the sample was heated to 300 °C and kept at this temperature for 3 h. Au content was determined by Inductively Coupled Plasma Mass Spectrometry (ICP-MS, Thermo Fisher Scientific). XPS spectra were performed by an ESCALAB 250 Xi XPS system of Thermo Scientific, where the analysis chamber was 1.5×10⁻⁹ mbar, and the X-ray spot was 500 µm.

²Au content was determined by ICP-MS; ³Surface areas and pore size distributions of the samples were calculated by using the Brunauer-Emmett-Teller (BET) equation and the Barrett-Joyner-Halenda (BJH) method, respectively.
