1. Experimental methods.

1.1 Materials and measurements

All reagents and solvents were used as received from commercial suppliers without further purification. Analyses for C, H, and N were carried out on a CE-440 elemental analyzer. Thermogravimetric analyses (TGA) were performed under a N₂ atmosphere (100 ml/min) using a TA SDT-600 thermogravimetric analyzer with a heating rate of 2 °C/min. The IR spectra were recorded using a Bruker TENSOR 27 FT-IR spectrophotometer in KBr mode. Analyses for Li and In were carried out using an ICP-MAS analyzer. Calibration curves for ICP-MAS were prepared by dilution of commercially available standards with the sample dissolved in concentrated HNO₃, and diluted to an appropriate concentration for measurement. Powder X-ray diffraction (PXRD) data were collected over the 2θ range 4-50° on a Bruker Advanced D8 diffractometer using Cu-Kα radiation (λ = 1.54056 Å, 40 kV/40mA).

1.2 Single crystal X-ray diffraction studies

X-ray diffraction data of single crystals of NOTT-210, NOTT-211 and NOTT-213 were collected at 293(2) K on an Oxford Diffraction Xcalibur diffractometer equipped with a Sapphire-3 CCD detector. X-ray diffraction data of single crystals of NOTT-212 were collected at 120(2) K on Station 9.8 of the Synchrotron Radiation Source at STFC Daresbury Laboratory. The structures were solved by direct methods and developed by difference Fourier techniques using the SHELXTL software package.¹ The hydrogen atoms on the ligands were placed geometrically and refined using a riding model. Geometric restraints were applied to the phenyl ring and the carboxylate group of the organic ligand. The unit cell volume includes a large region of disordered solvents which could not be modelled as discrete atomic sites. We employed PLATON/SQUEEZE² to calculate the contribution to the diffraction from the solvent region and thereby produced a set of solvent-free diffraction intensities. The final formula was calculated from the SQUEEZE results combined with elemental analysis and TGA data: the contents of the solvent/cation region are therefore represented in the unit
Supplementary Material (ESI) for Faraday Discussions

This journal is (c) The Royal Society of Chemistry 2011

cell contents but were not included in the refinement model. Single crystal data and refinement results
are summarised in Table S1.

1.3 Gas adsorption isotherms

H₂ and N₂ isotherms (pressure range 0-1.0 bar, measured with a high resolution pressure transducer) were recorded at 77 K (liquid nitrogen) or 87 K (liquid argon) on an IGA-003 system (Hiden Isochema, Warrington, UK) at the University of Nottingham under ultra-high vacuum in a clean system with a diaphragm and turbo pumping system. Ultra-pure plus grade (99.9995%) H₂ and N₂ were purchased from BOC and purified further using calcium aluminosilicate and activated carbon adsorbents to remove trace amounts of water and other impurities before introduction into the IGA system. Powder samples were loaded into the IGA and degassed at 80-120 °C and 10⁻¹⁰ bar for 1 day to give desolvated samples. In a typical procedure, 50-100 mg of dry sample was used for the measurements. The densities of desolvated samples used in buoyancy corrections were 1.60-1.80 g cm⁻³ for complexes in this study. This was estimated from the crystallographic density of the desolvated sample and PLATON/SQUEEZE²⁸ result. The density of bulk H₂ at 77 K in the buoyancy
correction was calculated by the Redlich-Kwong-Soave equation of state of H₂ incorporated in the IGASWIN software of the IGA system. The density of liquid H₂ at the boiling point (0.0708 g cm⁻³) was used for the adsorbate buoyancy correction. Pore size distribution (PSD) data were obtained by applying Dubinin-Astakhov analysis of the N₂ isotherms at 77 K. The analyses were carried out with IGASwin V1.03.181, and the constants for N₂ were: sorbate phase density = 0.808 g/cc; surface tension = 8.85 mN/m; DA interaction constant = 2.96 kJnm³/mol.

1.4 Inelastic neutron scattering

The rotational transitions of adsorbed H₂ molecules can be observed using inelastic neutron spectroscopy (INS). INS spectra were recorded on the TOSCA spectrometer at the ISIS Facility of the Rutherford Appleton Laboratory (UK) for energy transfers between ~2 and 500 meV. In this region TOSCA has a high resolution of ~2% ~E/E, corresponding to ~0.3 meV, facilitating the observation of individual excitations. The sample was loaded with para-hydrogen (H₂), which was prepared in a separate cryostat using a magnetic catalyst and low-temperature H₂. The amount of H₂ loaded was determined volumetrically via calculation from the calibrated pipe volume and the gas pressure.

Using an argon glove box, the desolvated NOTT-209 sample was loaded into a cylindrical vanadium sample container with an annealed copper vacuum seal and connected to a gas handling system. The sample was degassed at 10⁻³ Pa and 60-120 °C to remove any remaining trace guest solvent molecules. The temperature during data collection was controlled using a helium cryostat (± 0.5 °C). H₂ gas was loaded and unloaded at various stages during the experiments, and the amounts monitored. Each loading of H₂ was performed at 50 K in order to make sure that H₂ was present in the gas phase when not adsorbed and also to ensure sufficient mobility of H₂ inside the crystalline NOTT-209 structure. Subsequently, the temperature was reduced to below 15 K in order to perform the scattering measurement with as far as possible reduced thermal motion for the H₂. Background spectra (sample can plus NOTT-209) were subtracted to obtain the spectra of adsorbed dihydrogen.
2. Synthesis of complexes

Synthesis of $[\text{H}_2\text{ppz}][\text{In}(\text{L}^6)_2](\text{DMF})_{3.5}(\text{H}_2\text{O})_5$ (NOTT-200-solv).

$\text{H}_4\text{L}^6$ (0.015 g, 0.031 mmol), $\text{In(NO}_3)_3$ (0.009 g, 0.031 mmol) and piperazine (0.015 g, 0.18 mmol) were mixed and dispersed in a mixture of DMF/CH$_3$CN (3 ml, 2:1 v/v). The resulting white slurry turned clear upon addition of two drops of 6M HNO$_3$ solution. The solution was then heated to 90°C for 1 day and colourless octahedral crystals of NOTT-200-solv were separated by filtration, washed with DMF and dried in air. Yield: 0.035 g (70%). Elemental analysis (% calc/found): In$_2$O$_2$C$_{70.5}$H$_{74.5}$N$_{5.5}$ (In: 14.17/13.68; C 52.25/52.19; H 4.63/4.45; N 4.75/4.65). Selected IR: $\nu$ (cm$^{-1}$) = 3630(w), 3015(w), 2946(w), 2811(w), 2324(w), 1718( s), 1572(m), 1435(m), 1365(vs), 1251(m), 1021(m), 918(m), 826(m), 776(s), 751(s), 663(w).

Synthesis of $[\text{Li}_{1.5}(\text{H}_3\text{O})_{0.5}][\text{In}(\text{L}^6)_2](\text{H}_2\text{O})_{11}$ (NOTT-201-solv).

To prepare the Li$^+$-exchanged sample NOTT-201-solv, crystals of as-synthesized NOTT-200-solv were immersed in a saturated solution of LiCl in distilled water/acetone (1:1 v/v) at room temperature. The crystals were soaked for 10 days and the LiCl solution refreshed three times daily. Upon decanting the metal chloride solutions, the cation-exchanged crystals of NOTT-201-solv were rinsed and soaked in distilled water/acetone (1:1 v/v) for 3 days to remove residual free LiCl. Elemental analysis (% calc/found): In$_2$O$_{27.5}$C$_{50.5}$H$_{51.5}$Li$_{1.5}$ (In: 16.35/15.93; Li: 0.74/0.72; C 47.62/47.89; H 3.76/3.70; N 0.0/0.0). Selected IR: $\nu$ (cm$^{-1}$) = 3621(w), 3031(w), 2947(w), 2161(m), 1701(m), 1617(s), 1560(s), 1362(vs), 1248(m), 1076(m), 916(m), 857(m), 774(s), 754(s), 661(w).

Synthesis of $[\text{Me}_2\text{NH}_2][\text{In}(\text{L}^1)](\text{DMF})(\text{CH}_3\text{CN})(\text{H}_2\text{O})_{4}$ (NOTT-204-solv).

$\text{H}_4\text{L}^1$ (0.015 g, 0.045 mmol) and In(NO$_3)_3$ (0.014 g, 0.045 mmol) were mixed and dispersed in a mixture of DMF/CH$_3$CN (3.0 ml, 2:1 v/v). The resulting white slurry turned clear upon addition of two drops of 6M HNO$_3$ solution. The solution was then heated to 90°C for 1 day and the colourless octahedral crystalline product separated by filtration, washed with DMF and dried in air. Yield: 0.023 g (70%). Elemental analysis (% calc/found): InO$_{13}$C$_{23}$H$_{32}$N$_3$ (C 41.0/39.0, H 4.8/4.4, N 6.3/7.1). Selected IR: $\nu$ (cm$^{-1}$) = 3443(w), 2926(w), 1650(vs), 1569(m), 1490(w), 1410(s), 1384(vs), 1253(m), 1094(m), 1060(m), 907(w), 856(w), 773(m), 747(s), 659(m).
Synthesis of $\text{[Li}_{0.5}(\text{H}_3\text{O})_{0.5})\text{[In(L)}^1\text{)](H}_2\text{O})_5\text{(C}_3\text{H}_6\text{O})_{0.5}$ \text{(NOTT-205-solv}).

To prepare the Li$^+$-doped sample NOTT-205-solv, crystals of as-synthesized NOTT-204-solv were immersed in a concentrated solution of LiCl in distilled water/acetone (1:1 v/v). The crystals were soaked for 10 days and the LiCl solution refreshed every day. Upon decanting the metal chloride solutions, the cation-exchanged crystals of NOTT-205-solv were rinsed and soaked in distilled water/acetone (1:1 v/v) for 3 days to remove residual free LiCl from the pores of NOTT-205-solv.

Elemental analysis (% calc/found): InO$_{14}$C$_{17.5}$H$_{20.5}$Li$_{0.5}$ (C 36.6/34.9, H 3.6/2.9, N 0.0/0.0). Selected IR: $\nu$ (cm$^{-1}$) = 3469(w), 2927(w), 1703(m), 1612(m), 1552(m), 1418(s), 1364(vs), 1229(m), 1090(m), 992(m), 913(w), 782(m), 710(m), 657(m).

Synthesis of $\text{[(Me}_2\text{NH})_2(\text{H}_3\text{O})_2\text{][In}_2(L^7)_2\text{](DMF)}_4\text{(H}_2\text{O})_5$ \text{(NOTT-206-solv}).

H$_4$L$^7$ (0.015 g, 0.029 mmol) and In(NO$_3$)$_3$ (0.0089 g, 0.029 mmol) were mixed and dispersed in a mixture of DMF/CH$_3$CN (3 ml, 2:1 v/v). The resulting white slurry turned clear upon addition of two drops of 6M HNO$_3$ solution. The solution was then heated to 90°C for 1 day and colourless octahedral crystals of NOTT-206-solv were separated by filtration, washed with DMF and dried in air.

Yield: 0.039 g (80%). Elemental analysis (% calc/found): In$_2$O$_{26}$C$_{74}$H$_{81}$N$_5$ (In 13.62/13.25; C 52.71/52.69; H 4.84/4.51; N 4.15/4.07). Selected IR: $\nu$ (cm$^{-1}$) = 3620(m), 3009(m), 2956(w), 2801(w), 2326(w), 1720(s), 1435(m), 1360(vs), 1250(m), 1011(m), 918(m), 777(s), 663(w).

Synthesis of $\text{[Li}_{1.2}(\text{H}_3\text{O})_{0.8})\text{[In}_2(L^7)_2\text{](H}_2\text{O})_{14}$ \text{(NOTT-207-solv)}.

To prepare the Li$^+$-exchanged sample NOTT-207-solv, crystals of as-synthesized NOTT-206-solv were immersed in a saturated solution of LiCl in distilled water/acetone (1:1 v/v) at room temperature. The crystals were soaked for 10 days and the LiCl solution refreshed three times daily. Upon decanting the metal chloride solutions, the cation-exchanged crystals of NOTT-207-solv were rinsed and soaked in distilled water/acetone (1:1 v/v) for 3 days to remove residual free LiCl.

Elemental analysis (% calc/found): In$_2$O$_{30.8}$C$_{60}$H$_{62.4}$Li$_{1.2}$ (In 15.16/14.76; C 47.59/47.55; H 4.15/4.27; Li 0.55/0.53; N 0.0/0.0). Selected IR: $\nu$ (cm$^{-1}$) = 3629(w), 3011(w), 2956(w), 2162(m), 1705(m), 1617(s), 1566(s), 1383 (vs), 1077(m), 916(m), 774(s), 656(w).
Synthesis of $[\text{H}_2\text{ppz}][\text{In}_2(L^8)_2](\text{DMF})_4(\text{H}_2\text{O})_{8.5}$ (NOTT-208-solv).

$\text{H}_4L^8$ (0.015 g, 0.027 mmol), piperazine (0.015 g, 0.18 mmol) and $\text{In(NO}_3)_3$ (0.0081 g, 0.027 mmol) were mixed and dispersed in a mixture of DMF/CH$_3$CN (3 ml, 2:1 v/v). The resulting white slurry turned clear upon addition of two drops of 6M HNO$_3$ solution. The solution was then heated to 90°C for 1 day and colourless octahedral crystals of NOTT-208-solv were separated by filtration, washed with DMF and dried in air. Yield: 0.022 g (90%). Elemental analysis (% calc./found): In$_2$O$_2$C$_{87}$H$_{87}$N$_6$ (In 12.63/12.26; C 55.49/55.53; H 4.82/5.03; N 4.62/4.76). Selected IR: $\nu$ (cm$^{-1}$) = 3622(m), 3016 (m), 2950(w), 2800(w), 2336 (w), 1727(s), 1440(m), 1360(vs), 1252(m), 1011(m), 912(m), 770(s), 668(w).

Synthesis of $[\text{Li}_{1.4}(\text{H}_3\text{O})_{0.6}][\text{In}_2(L^8)_2](\text{Ace})_4(\text{H}_2\text{O})_{11}$ (NOTT-209-solv).

To prepare the Li$^+$-exchanged sample NOTT-209-solv, crystals of as-synthesized NOTT-208-solv were immersed in a saturated solution of LiCl in distilled water/acetone (1:1 v/v) at room temperature. The crystals were soaked for 10 days and the LiCl solution refreshed three times daily. Upon decanting the metal chloride solutions, the cation-exchanged crystals of NOTT-209-solv were rinsed and soaked in distilled water/acetone (1:1 v/v) for 3 days to remove residual free LiCl. Elemental analysis (% calc./found): In$_2$O$_3$C$_{80}$H$_{83.8}$Li$_{1.4}$ (In 12.83/12.55; C 53.67/53.86; H 4.72/4.73; Li 0.54/0.52; N 0.0/0.0). Selected IR: $\nu$ (cm$^{-1}$) = 3634(w), 3010(w), 2967(w), 2152(m), 1700(m), 1610(s), 1552(s), 1380 (vs), 1070(m), 926(m), 775(s), 656(w).

Synthesis of $[\text{Me}_2\text{NH}_2][\text{InL}_2](\text{DMF})_2(\text{H}_2\text{O})_4$ (NOTT-210-solv).

$\text{H}_4L^2$ (0.015 g, 0.037 mmol) and In(NO$_3)_3$ (0.011 g, 0.037 mmol) were mixed and dispersed in a mixture of DMF/CH$_3$CN (3 ml, 2:1 v/v). The resulting white slurry turned clear upon addition of two drops of 6M HNO$_3$ solution. The solution was then heated to 90°C for 1 day and colourless octahedral crystals of NOTT-210-solv were separated by filtration, washed with DMF and dried in air. Yield: 0.023 g (80%). Elemental analysis (% calc./found): InO$_{14}$C$_{30}$H$_{60}$N$_3$ (C 46.11/45.22; H 5.16/5.03; N 5.38/4.76). Selected IR: $\nu$ (cm$^{-1}$) = 3421(m), 3021(w), 2947(w), 1701(m), 1617(s), 1555(s), 1363(vs), 1248(m), 920(m), 820(m), 754(s).
Synthesis of $[\text{Me}_2\text{NH}_2][\text{InL}_3](\text{DMF})_2(\text{H}_2\text{O})_2$ (NOTT-211-solv).

$\text{H}_4\text{L}_3$ (0.015 g, 0.035 mmol) and $\text{In(NO}_3)_3$ (0.010 g, 0.035 mmol) were mixed and dispersed in a mixture of DMF/CH$_3$CN (3 ml, 2:1 v/v). The resulting white slurry turned clear upon addition of two drops of 6M HNO$_3$ solution. The solution was then heated to 90°C for 1 day and colourless octahedral crystals of NOTT-211-solv were separated by filtration, washed with DMF and dried in air. Yield: 0.024 g (90%). Elemental analysis (% calc/found): InO$_{12}$C$_{32}$H$_{38}$N$_3$ (C 49.82/48.22; H 4.96/5.06; N 5.45/5.20). Selected IR: $\nu$ (cm$^{-1}$) = 3431(m), 3041(w), 2962(w), 1708(m), 1612(s), 1555(s), 1367(vs), 1268(m), 910(m), 810(m), 755(s).

Synthesis of $[\text{Me}_2\text{NH}_2][\text{InL}_4](\text{DMF})_2(\text{H}_2\text{O})_4$ (NOTT-212-solv).

$\text{H}_4\text{L}_4$ (0.015 g, 0.024 mmol) and $\text{In(NO}_3)_3$ (0.007 g, 0.024 mmol) were mixed and dispersed in a mixture of DMF/CH$_3$CN (3 ml, 2:1 v/v). The resulting white slurry turned clear upon addition of two drops of 6M HNO$_3$ solution. The solution was then heated to 90°C for 1 day and colourless octahedral crystals of NOTT-212-solv were separated by filtration, washed with DMF and dried in air. Yield: 0.014 g (70%). Elemental analysis (% calc/found): InO$_{14}$C$_{30}$H$_{36}$F$_4$N$_3$ (C 42.22/41.00; H 4.25/4.20; N 4.92/5.10). Selected IR: $\nu$ (cm$^{-1}$) = 3441(m), 2962(w), 1700(m), 1615(s), 1565(s), 1368(vs), 1269(m), 910(m), 812(m), 753(s).

Synthesis of $[\text{Me}_2\text{NH}_2][\text{InL}_5](\text{DMF})_2(\text{H}_2\text{O})_2$ (NOTT-213-solv).

$\text{H}_4\text{L}_5$ (0.015 g, 0.033 mmol) and $\text{In(NO}_3)_3$ (0.010 g, 0.033 mmol) were mixed and dispersed in a mixture of DMF/CH$_3$CN (3 ml, 2:1 v/v). The resulting white slurry turned clear upon addition of two drops of 6M HNO$_3$ solution. The solution was then heated to 90°C for 1 day and colourless octahedral crystals of NOTT-213-solv were separated by filtration, washed with DMF and dried in air. Yield: 0.023 g (90%). Elemental analysis (% calc/found): InO$_{12}$C$_{34}$H$_{36}$N$_3$ (C 51.47/51.00; H 4.57/4.40; N 5.30/5.12). Selected IR: $\nu$ (cm$^{-1}$) = 3450(m), 3051(w), 2962(w), 1705(m), 1620(s), 1555(s), 1368(vs), 1270(m), 920(m), 810(m), 755(s).
3. TGA plots for NOTT-210, NOTT-211, NOTT-212 and NOTT-213

Figure 1s. TGA plots for NOTT-210, NOTT-211, NOTT-212 and NOTT-213.

Figure 2s. Comparison of simulated, experimental and desolvated PXRD patterns for NOTT-210-solv (a), NOTT-211-solv (b), NOTT-212-solv (c) and NOTT-213-solv (d).

Framework structures of desolvated NOTT-210, NOTT-211, NOTT-212 and NOTT-213 are not stable on desolvation. Thus, no apparent N₂ adsorption was observed for these four materials (see Fig. 3s for example), and BET areas for these desolvated materials are estimated to be ~20 m²g⁻¹, which is close to the surface area for powder solid materials.
Figure 3s. N$_2$ sorption isotherms at 77 K for NOTT-210.
