General. All new compounds were characterized by \textsuperscript{1}H- and \textsuperscript{13}C-NMR and elemental analyses. \textsuperscript{1}H- and \textsuperscript{13}C-NMR spectra were recorded at 400 and 100.62 MHz, respectively, on a Bruker Avance-DRX 400 instrument. Elemental analyses were carried out on a Carlo Erba 1106 elemental analyzer. Starting acyl chlorides are commercially available and have been used without further purifications.

Synthesis of PhSeZnCl (1a), PhSeZnBr (1b) and PhSZnCl (2):

PhSeZnCl 1a and PhSeZnBr 1b have been prepared according to previously reported procedure.\textsuperscript{[1]} PhSZnCl 2 has been synthesized by adding to a solution of (PhS)$_2$ (10.0 mmol) in diethyl ether (20 mL) SO$_2$Cl$_2$ (10.0 mmol) at 0°C under stirring to form the corresponding PhSCI. After 30 minutes the solvent was evaporated under vacuum. The yellow solid was dissolved in THF and 10.0 mmol of zinc powder was added at reflux. After 20 minutes the mixture, became colorless, was filtered and PhSZnCl was precipitated from petroleum ether as with solid and washed more time with the same solvent.

General procedure for the “on water” nucleophilic acyl substitution mediated by PhSeZnCl (1a), PhSeZnBr (1b) and PhSZnCl (2).

0.13 mmol of 1a-b or 2 and 0.13 mmol of acyl chloride were poured in 4mL of water and vigorously stirred at 23 °C for 3 hours. Then the aqueous phase was extracted 3 times with ethyl acetate. The collected organic layers were washed with brine, dried over Na$_2$SO$_4$, filtered and the solvent removed under vacuum. Products 4d, 4f, 5f, 4g, 4i and 4m were purified by flash chromatography using petroleum ether-ethyl acetate (19:1). Products 4a, 5a, 4b, 5b, 4c, 4e, 4h and 4i have been purified by recrystallization from ethyl acetate-hexane. Yields reported on table 2 refer to the isolated products.
