This supporting information contains representative HPLC chromatograms of products, the external standard used and the GC-MS chromatograms.

1. Copies of representative chromatograms:

![HPLC Chromatograms](image)

Figure S1 Typical HPLC analytical profiles of (A) aqueous solution measured by refractive index detector and (B) organic solution measured by UV detector.

Reaction condition: 1g cellulose, 40ml THF, 4ml water; 1.8mmol NaHSO\textsubscript{4} and 2.8mmol ZnSO\textsubscript{4}; temperature 433K; reaction time 60min.

2. The used external standard:

The external standard method was built as follow: 1g cellobiose, D-glucose, D-fructose, HMF, furfural and levulinic acid were added into 1000ml of pure water to form a mother solution, and then this mother solution was diluted to 1.25times, 2.5times, 5times, 10times, 20times, 40times,
100 times and 500 times. All these samples were analyzed by HPLC, and a standard curve was obtained where the peak area is a function of concentration of each chemical. The retention times of glucose, fructose, levulinic acid, HMF and furfural are 10.1 min, 10.9 min, 18.3 min, 36.6 min and 55.9 min, respectively. This standard curve was applicable for the concentration from 0.002 g/L to 1 g/L.

3. Copies of GC-MS of products

![GC spectrum of products](image)

**Figure S2** GC spectrum of products in organic phase.

Reaction condition: 1 g cellulose, 40 ml THF, 4 ml water; 1.8 mmol NaHSO₄ and 2.8 mmol ZnSO₄; temperature 433 K; reaction time 60 min.
