**General methods:** Dry solvents were purchased and stored under nitrogen over molecular sieves (bottles with crown caps). Tris[(1-benzyl-1H-1,2,3-triazol-4-yl)methyl]amine\(^{[1]}\) and 4-azidomethylstyrene\(^{[2]}\) were prepared as described. Divinylbenzene (Aldrich, tech. grade, 80%, mixture of isomers) was filtered through neutral alumina before use and stored at -20°C under N\(_2\). The other chemicals were used as received. Reactions were monitored by analytical thin-layer chromatography (TLC) using silica gel 60 F254 pre-coated glass plates (0.25 mm thickness) and visualized using UV light. Flash chromatography was carried out on silica gel (230-400 mesh). \(^1\)H NMR and \(^{13}\)C NMR spectra were recorded at 25°C with a Varian Inova 600 spectrometer working at the frequency of 599.68 MHz and 150.81 MHz, respectively or with a Bruker Fourier 300 or AMX 300 at the frequency of 300 and 75 MHz respectively. The relaxation delay \(d\) between pulses in \(^1\)H NMR and \(^{13}\)C NMR experiments was set to 10 s and 1 s, respectively. Chemical shifts values (\(\delta\)) are reported in part per million (ppm). Peak multiplicity is summarized as br. (broad), s (singlet), d (doublet), t (triplet), m (multiplet). Electrospray ionization mass spectra [MS(ESI)] were recorded as methanol solutions by using a AB Sciex Instruments triple quadrupole LC/MS/MS API 365 mass spectrometer. The BET surface area was determined by nitrogen adsorption using a ThermoQuest Surface Area Analizer Qsurf S1. Enantiomeric excess determinations were performed under the conditions reported below with Agilent 1200 series HPLC.

**Preparation of imidazolidinone (2) (Known compound):**\(^{[3]}\)

\[

\text{O} & \quad \text{Me} \\
\text{Me} & \quad \text{Me} \\
\end{align*}
\]

To a stirred portion of butylamine (10 mL, 101.2 mmol) kept under nitrogen, (S)-tyrosine methylester (6 g, 30.8 mmol) was added and the mixture was stirred for 24 h at room temperature. After addition of CH\(_2\)Cl\(_2\), the reaction was then evaporated under vacuum giving 7.2 g of a pale yellow solid that was used for the next reaction without any further purification step. The compound was dissolved in CH\(_3\)OH (60 mL) and acetone (60 mL), and PTSA (60 mg) was added. The mixture was refluxed for 24 h and concentrated under vacuum to afford 8.4 g of the crude imidazolidinone that was used for the next reaction without any further purification step. It had m.p. 99-101°C. \([\alpha]_D^{22} –78.2 \ (c = 0.72 \text{ in CH}_2\text{Cl}_2)\); \(^1\)H NMR (CDCl\(_3\)/D\(_2\)O): \(\delta\) 7.04 (B part of AB system, \(3J\ (\text{H,H}) = 8.5\ Hz, 2\text{H}; \text{aromatic protons}), 6.74 (A part of AB system, 3J (H,H) = 8.5 Hz, 2H; aromatic protons), 3.73 (t, 3J (H,H) = 5.8 Hz, 1H; CHN), 3.29 (ddd, 2J (H,H) = 12.0 Hz, 3J (H,H) = 6.7 and 3.2 Hz, 1H; one H of NCH\(_2\)), 3.04 (ddd, 2J (H,H) = 12.0 Hz, 3J (H,H) = 5.8 and 5.4 Hz, 2H; ArCH\(_2\)), 2.89 (ddd, 2J (H,H) = 12.0 Hz, 3J (H,H) = 6.2 and 3.1 Hz, 1H; one H of NCH\(_2\)), 1.43-1.49 (m, 2H; NCH\(_2\)CH\(_3\)), 1.21-1.31 (m, 2H; CH\(_3\)), 1.27 (s, 3H; CMe), 1.17 (s, 3H; CMe), 0.90 (t, 3J (H,H) = 7.3 Hz, 3H; CH\(_2\)CH\(_3\)); \(^{13}\)C NMR: \(\delta\) 174.2, 155.8, 130.7, 127.2, 115.7, 76.4, 58.9, 40.4, 35.5, 31.3, 27.8, 26.3, 20.3, 13.7; IR: 3270, 1675, 1620 cm\(^{-1}\); elemental analysis calcd for C\(_{16}\)H\(_{24}\)N\(_2\)O\(_2\) (276.4): C 69.53, H 8.75, N 10.14; found: C 69.71, H 8.64, N 10.23.

To a solution of the crude imidazolidinone (5 g, 18 mmol) in dry acetonitrile (40 mL) potassium carbonate (20 g, 145 mmol). was added and the mixture was cooled to 0°C with an external ice water bath; propargyl bromide solution (80% wt. in toluene, 8 mL, 72 mmol) was added dropwise over 15 min. and the resulting mixture was allowed to warm to Room Temperature and stirred under inert
atmosphere for 24 hours. The reaction mixture was then filtered through a celite plug and the solvent was removed under vacuum; the crude product was purified by flash column chromatography (eluent: CH\(_2\)Cl\(_2\)/MeOH = 98/2) to afford compound 2 as a brownish oil (15.9 mmol, 88%).

**TLC** \(R_f = 0.47\) (CH\(_2\)Cl\(_2\)/MeOH = 98/2)

\(^1\)H-NMR (300 MHz, CDCl\(_3\)): \(\delta 7.12\) (d, 2H, Ar-H); 6.85 (d, 2H, Ar-H); 4.59 (d, 2H, -O-CH\(_2\)); 3.65 (t, 1H, -NH-CH\(_2\)); 3.23-3.20 (m, 1H, -N-C\(_2\)H\(_2\)); 2.97 (dd, 2H, Ar-CH\(_2\)); 2.96-2.84 (m, 1H, -N-CH\(_2\)); 2.46 (t, 1H, -C≡CH); 1.41 (m, 2H, -N-CH\(_2\)C\(_6\)H\(_5\)); 1.29-1.24 (m, 2H, C\(_6\)H\(_5\)-CH\(_3\)); 1.20 (s, 3H, -C-C\(_3\)H\(_3\)); 1.09 (s, 3H, -C-C\(_3\)H\(_3\)); 0.86 (t, 3H, -CH\(_2\)-C\(_3\)H\(_3\)).

13C-NMR (75 MHz, CDCl\(_3\)): \(\delta 174.1\) (1C, -C=O); 156.8 (1C, Ar-C-O-); 131.0 (2C, Ar-C\(_6\)H\(_5\)); 130.1 (1C, Ar-\(\equiv\)C); 115.2 (2C, Ar-CH\(_2\)); 78.8 (1C, -C\(_3\)H\(_2\)); 76.3 (1C, -N-C-NH-); 75.7 (1C, -C≡CH); 59.1 (1C, -NH-CH\(_2\)-C\(_6\)H\(_5\)); 56.1 (1C, -O-CH\(_2\); 40.5 (1C, -N-CH\(_2\)); 36.2 (1C, Ar-CH\(_2\)); 31.7 (1C, -N-CH\(_2\)-CH\(_3\)); 28.3 (1C, -C\(_3\)H\(_3\)); 26.8 (1C, -C\(_3\)H\(_3\)); 20.6 (1C, -CH\(_2\)-CH\(_3\)); 14.0 (1C, -CH\(_2\)-CH\(_3\)).

**IR**: 3302, 2961, 1685, 1610 cm\(^{-1}\)

**Preparation of MacMillan monomer (3):**

A 25mL flame-dried Schlenk tube was charged under nitrogen with CuCl (5.5 mg, 0.056 mmol, 0.05 equiv.), tris[(1-benzyl-1H-1,2,3-triazol-4-yl)methyl]amine (29.5 mg, 0.0556 mmol, 0.05 equiv.) and freshly distilled CH\(_2\)Cl\(_2\) (4 mL). After stirring for 10 min, the MacMillan-alkyne derivative 2 (350 mg, 1.13 mmol) in CH\(_2\)Cl\(_2\) (5 mL) was added, followed by 4-azidomethylstyrene (354 mg, 2.23 mmol, 2 equiv.) in CH\(_2\)Cl\(_2\) (4 mL). The pale-brownish suspension was degassed by three vacuum/N\(_2\) cycles and the Schlenk tube was sealed under nitrogen and kept stirring at r.t. After complete conversion of 2 (20 h, TLC monitoring), the reaction mixture was concentrated to approx. 10 mL and directly loaded onto a silica-gel column. By eluting with EtOAc, the pure monomer 3 was obtained as pale-yellow viscous oil (458 mg, 0.967 mmol, 86% yield).

**TLC** \(R_f = 0.20\) (SiO\(_2\), EtOAc)

\(^1\)H NMR (600 MHz, CDCl\(_3\)): \(\delta 7.50\) (s, 1H), 7.40 (d, \(J = 8.0\) Hz, 2H), 7.23 (d, \(J = 8.0\) Hz, 2H), 7.12 (d, \(J = 8.4\) Hz, 2H), 6.87 (d, \(J = 8.6\) Hz, 2H), 6.69 (dd, \(J = 17.6, 10.9\) Hz, 1H), 5.73-5.58 (m, 1H), 5.50 (s, 2H), 5.26-5.30 (m, 1H), 5.13 (s, 2H), 3.70 (t, \(J = 5.3\) Hz, 1H), 3.28 (ddd, \(J = 14.3, 9.8, 6.0\) Hz, 1H), 3.04 (dd, \(J = 14.3, 5.8\) Hz, 1H), 2.99 (dd, \(J = 14.3, 4.8\) Hz, 1H), 2.88 (ddd, \(J = 14.5, 9.8, 5.6\) Hz, 1H), 1.62 (br. s, NH+H\(_2\)O), 1.54 - 1.38 (m, 2H), 1.30-1.25 (m, 2H), 1.24 (s, 3H), 1.13 (s, 3H), 0.90 (t, \(J = 7.4\) Hz, 3H).

\(^13\)C NMR (151 MHz, CDCl\(_3\)): \(\delta 173.8, 157.1, 144.5, 138.1, 135.9, 133.8, 130.7, 129.4, 128.3, 126.8, 122.6, 114.9, 114.7, 76.0, 62.0, 58.8, 53.9, 40.2, 35.9, 31.4, 28.0, 26.5, 20.3, 13.7.

HRMS Mass (ESI+) m/z calc. for C\(_{28}\)H\(_{35}\)N\(_5\)O\(_2\)H\(^+\): 474.2871, found: 474.2874 [M + H].
Preparation of MacMillan Monolith (Supp3):

The feed solution for the monolith synthesis was prepared by mixing monomers, porogenic solvents, and the radical initiator in the following order: MacMillan-monomer 3 (0.289 g, 0.610 mmol, 25 wt% of monomers), toluene (0.400 g), 1-dodecanol (1.150 g), divinylbenzene (0.900 g, 75 wt% of monomers), and AIBN (12 mg, 1 wt %). The mixture was deoxygenated by slowly bubbling nitrogen for 10 minutes under stirring. The resulting solution was poured in a stainless steel HPLC column sealed at the bottom end (0.46 cm i.d. × 15 cm), paying attention to fill completely the available volume. The top end was sealed under nitrogen and the column was weighed in order to determine the exact amount of the feed mixture (2.16 g, 0.484 mmol of the chiral monomer 3). The monolith formation was carried out by placing the column vertically into a preheated oil bath (70°C) and keeping for 18 h at the same temperature. After cooling to r.t., the seals were replaced by metal frits and the soluble components were removed by flushing the column with 150 mL dry THF (syringe pump, flow-rate \( \phi = 300 \mu\text{L min}^{-1} \)). Evaporation of the volatiles from the eluate afforded 0.90 g of a clear oil consisting of essentially pure 1-dodecanol (NMR and TLC). UV check indicated that the concentration of the chiral derivative into the final washings was lower than 7-10^{-5} M.

For comparison purposes, a portion of the feed mixture was subjected to copolymerization in a sealed vial placed in the same oil bath used for the preparation of the column monolith. The recovered colourless opaque mass was crushed and washed thoroughly with dry THF. After removal of the volatiles under reduced pressure (10^{-2} mmHg), the resulting white powder was subjected to IR characterization, determination of BET surface area by N\(_2\) adsorption, and employed in reference catalytic runs in batch.

IR(KBr pellet) \( \nu \) (cm\(^{-1}\)): 3020, 2927, 2869, 1695, 1605, 1512, 1448, 1245, 905, 830, 798, 710. BET Surface area: 485 m\(^2\) g\(^{-1}\).
Diels-Alder cycloaddition

Flow reaction

The monolithic reactor containing 0.93 g of imidazolidinone organocatalyst Supp-3 (loading 0.51 mmol/g, 0.475 mmol of catalyst) was flow-treated overnight with trifluoroacetic acid (TFA) solution (0.2 M in a 95/5 CH$_3$CN/H$_2$O mixture) or a 48% solution in water of HBF$_4$ (0.2 M in a 95/5 CH$_3$CN/H$_2$O mixture). After this treatment, the column was washed with 5 ml of 95/5 CH$_3$CN/H$_2$O mixture to remove excess acid. The Diels-Alder cycloaddition reaction was then carried out at 25°C, by pumping a solution of the reagents (trans-cinnamaldehyde 0.195 M, 1eq and cyclopentadiene 1.365 M, 7eq in a 95/5 CH$_3$CN/H$_2$O mixture) through the reactor.

Batch reaction

Powder Supp-3 (0.11mmol, 200mg, 0.3eq), trifluoroacetic acid (0.11mmol, 8 µl) and the reagents trans-cinnamaldehyde (0.37mmol, 46µl, 1eq) and cyclopentadiene (2.59mmol, 214µl, 7eq) were mixed at room temperature in 2ml of a 95/5 CH$_3$CN/H$_2$O mixture. After 48 hours the polymer-supported catalyst was isolated by centrifugation and filtration and the organic phase was worked-up to obtain the products. The same amount of reagents was added and the same procedure was repeated after a reaction time of 24hours.

The same procedure was followed using a 48% solution in water of HBF$_4$ (0.11mMol, 7µl).

The endo/exo ratio was established on the crude product by using the CHO signals at $\delta$= 9.60 (endo) and 9.93 (exo) ppm. For ee determination the aldehyde was converted into the corresponding alcohol by reduction with an excess NaBH$_4$ in CH$_3$OH, 24°C, 1 h.

(1S, 2S, 3S, 4R)-3-phenylbicyclo[2.2.1]hept-5-ene-2-carbaldehyde and (1R, 2S, 3S, 4S)-3-phenylbicyclo[2.2.1]hept-5-ene-2-carbaldehyde: This product is known and was purified by flash column chromatography on silica gel with a 98:2 hexane/ethyl acetate mixture as eluant affording a mixture of endo and exo Diels-Alder adducts.

Data for endo:

$\text{TLC, } R_f= 0.42 \text{ (hex/EtOAc 9:1 stained blue with phosphomolibdic acid)}$

$^1$H-NMR (300 MHz, CDCl$_3$): $\delta$ 9.61 (d, $J$=2.2 Hz, 1H, CHO), 7.14-7.34 (m, 5H, Ph), 6.43 (dd, $J$=3.3, 5.6 Hz, 1H, CH=CH), 6.18 (dd, $J$=2.8, 5.7 Hz, 1H, CH=CH), 3.34 (brs, 1H, CHCH=CHCH), 3.14 (brs, 1H, CHCH=CHCH), 3.10 (d, $J$=4.8, 1H, CHPh), 2.99 (dd, $J$=2.7, 5.4, 1H, CHCHO), 1.82 (d, $J$=8.7, 1H, CHH), 1.61-1.64 (m, 1H, CHH).

Data for exo:

$\text{TLC, } R_f= 0.42 \text{ (hex/EtOAc 9:1 stained blue with phosphomolibdic acid)}$

$^1$H-NMR (300 MHz, CDCl$_3$): $\delta$ 9.93 (d, $J$=2.0 Hz, 1H, CHO), 7.14-7.34 (m, 5H, Ph), 6.34 (dd, $J$=3.4, 5.5 Hz, 1H, CH=CH), 6.08 (dd, $J$=3.0, 5.5 Hz, 1H, CH=CH), 3.73 (t, $J$=3.8, 1H, CHCH=CHCH), 3.23 (m, 2H, CHCH=CHCH, CHPh), 2.60 (dd, $J$=1.5, 3.4, 1H, CHCHO), 1.61-1.64 (m, 2H, CHH, CHH).
((1S, 2S, 3S, 4R) 3-phenylbicyclo[2.2.1]hept-5-en-2-yl)methanol and ((1R, 2S, 3S, 4S)-3-phenylbicyclo[2.2.1]hept-5-en-2-yl)methanol: 

This product is known and was injected into the HPLC without further purification.

Data of a mixture endo:exo:

$^1$H-NMR (300 MHz, CDCl$_3$): $\delta$ 7.18-7.31 (m, 10H), 6.34-6.41 (m, 2H), 6.15-6.20 (m, 1H), 5.93-5.98 (m, 1H), 3.86-3.94 (m, 1H), 3.59-3.70 (m, 3H), 3.39 (t, $J$=12.8 Hz, 1H), 3.04 (brs, 2H), 2.83-2.88 (m, 3H), 2.30-2.42 (m, 2H), 2.15-2.18 (m, 2H), 1.76-1.82 (d, $J$=8.9, 1H), 1.65-1.68 (d, $J$=8.7, 1H).

The enantiomeric excess was determined by chiral HPLC with Daicel Chiralcel OJ-H column [eluant: 7:3 hex/IPA; 0.8 mL/min flow rate, detection: 225 nm; $t_\text{r}$ 11.6 min (endo-minor), $t_\text{r}$ 23.9 in (endo-major) $t_\text{r}$ 30.3 min (exo-minor), $t_\text{r}$ 40.3 min (exo-major).
1,3 Dipolar cycloaddition:

The reaction was carried out at different temperatures (see text) by pumping a solution of the reagents (N-benzyl-C-phenyl nitrone 0.195 M and crotonic aldehyde 0.975 M in wet CH$_3$NO$_2$) through the reactor.

The endo/exo ratio was established on the crude product by using the CHO signals at $\delta= 9.81$ (endo) and 9.33 (exo) ppm. For ee determination the purified aldehyde was converted into the corresponding alcohol by reduction with an excess NaBH$_4$ in CH$_3$OH, 24°C, 1 h.

4-Formyl-5-methyl-3-phenyl-2-(phenylmethyl)isoxazolidine (11): This product is known$^5$ and was purified by flash column chromatography on silica gel with a 85:15 hexane/ethyl acetate mixture as eluant affording a mixture of endo and exo cycloadducts.

Data for endo:

TLC, $R_f$= 0.35 (hex/EtOAc 85:15 stained blue with phosphomolibdic acid)

$^1$H-NMR (300 MHz, CDCl$_3$): $\delta$ 9.81 (d, J=2.4 Hz, 1H, CHO), 7.28-7.49 (m, 10H, Ph), 4.58 (dq, J=6.1, 12.2 Hz, 1H, CHCH$_3$), 4.20 (d, J=7.8 Hz, 1H, CHPh), 4.02 (d, J=14.4 Hz 1H, CH$_2$Ph), 3.83(d, J=14.3 Hz 1H, CH$_2$Ph), 3.15 (m, 1H, CHCHO), 1.55 (d, J=6.2 Hz, 3H, -CH$_3$).

((3S,4S,5R)-2-benzyl-5-methyl-3-phenylisoxazolidin-4-yl)methanol:

This product is known and was injected into the HPLC without further purification

Data for endo:

$^1$H-NMR (300 MHz, CDCl$_3$): 7.23-7.48 (m, 10H, Ph), 4.21-4.25 (dq, 1H, CHCH$_3$), 3.98 (d, 1H, CH$_2$Ph), 3.78(d, 1H, CH$_2$Ph), 3.67 (m, 2H, CH$_2$OH), 3.64 (d, 1H, CHPh), 2.36-2.41 (m, 1H, CHCH$_2$OH), 1.45 (d, 3H, -CH$_3$).

The enantiomeric excess was determined by chiral HPLC with Daicel Chiralcel AD column; eluant: 95:5 hex/EtOH; 0.8 mL/min flow rate, detection: 230 nm; $t_R$ 11.6 min (endo-minor), $t_R$ 14.7 min (endo- major).
Friedel-Crafts alkylation:

The reaction was carried out at 25°C by pumping a solution of the reagents (trans-cinnamaldehyde 0.195 M and N-methyl pyrrole 0.975 M in wet THF) through the reactor.

(S)-3-Phenyl-3-(1-methyl-1H-pyrrol-2-yl)-propanal (13): This product is known;[6] it was converted into the corresponding alcohol by reduction with an excess NaBH₄ in CH₃OH, 24°C, 1 h and purified by flash column chromatography on silica gel with a 70:30 hexane/ethyl acetate mixture as eluent.

¹H-NMR (300 MHz, CDCl₃): δ 7.28-7.19 (m, 4H), 7.13 (m, 1H), 6.42 (d, 2H), 6.36 (t, 1H), 4.18 (t, 1H), 3.62-3.49 (m, 2H), 2.90 (s, 3H) 2.39-2.32 (m, 1H), 2.11-2.03 (m, 1H).

The enantiomeric excess was determined by chiral HPLC with Daicel Chiralcel OD-H column; eluant: 90:10 hex/IPA; 0.8 mL/min flow rate, detection: 210 nm; tᵣ 14.6 min (minor), tᵣ 46.1 min (major).

Totals: 1.16829e4 128.21379
1,3-Dipolar Cycloaddition

1H-NMR spectrum of an aliquot of crude reaction mixture under continuous flow conditions (4h running time, about 0.05 mmol, 13 mg)
$^1$H-NMR spectrum of the isolated products 11 at the end of the reaction under continuous flow conditions (30 h running time, -15 °C; entry 6 Table 7).
As a comparison, see the $^1$H-NMR spectrum of the isolated products 11 obtained using commercially available MacMillan catalyst.
$^1$H-NMR spectrum of endo-11 after reduction to the corresponding alcohol
**Additional Info:** Peak(s) manually integrated
