Table of Contents

Figure S1. X-ray diffraction patterns S2
Figure S2. XRD pattern of air synthesized sample annealed under N2 S2
Figure S3. N2 sorption isotherms of lithium manganospinels S3
Figure S4. Lithium manganospinel crystal structure S4
Figure S5. FTIR spectra of lithium manganospinels S5
Figure S6. TGA of air synthesized sample performed under N2 purge S5
Figure S7. Charge/ discharge curves for hydrothermally synthesized lithium manganospinels S6
Figure S8. Cycling behavior of lithium manganospinel synthesized in air and annealed at 270 °C and 310 °C. S7
Figure S9. Nyquist plots from EIS data collected from lithium manganospinels S8
Figure S1. XRD patterns of hydrothermally synthesized lithium manganospinel.

Figure S2. XRD pattern of lithium manganospinel synthesized hydrothermal in air followed by annealing under N\textsubscript{2}.
Figure S3. N$_2$ sorption isotherms for lithium manganospinels prepared hydrothermally. The top panels represent the synthesized samples and the bottom panels represent the annealed samples. All compounds type II isotherms with surface areas of ~60 m$^2$/g as determined from the Brunauer-Emmett-Teller (BET) method.
Figure S4. Unit cell of cubic $Fd\bar{3}m$ lithium manganospinel viewed along [110] highlighting the excess electron density observed in the refined neutron diffraction data at (0, 0.26, 0.73) shown in pink. Blue, orange, and red spheres represent Li, Mn, and O atoms respectively, with MnO$_6$ octahedra shaded in.
Figure S5. FTIR spectra of hydrothermally synthesized lithium manganospinels. Black and red traces represent the synthesized and annealed spectra for compounds prepared in a) air; b) N₂; c) O₂, respectively. ν(O–H) and δ(H–O–H) modes at 3300 and 1630 cm⁻¹ respectively indicate surface-bound water.

Figure S6. TGA of the air synthesized sample performed under N₂ purge. No mass gain associated with oxygen uptake between 250–350 °C is observed.
Figure S7. Individual chronopotentiometry profiles for C/3 cycling experiments shown in Figure X. The first charge-discharge cycle is in gold and the 100\textsuperscript{th} cycle is in red.
Figure S8. Cycling behavior of lithium manganospinel synthesized in air and annealed at (a) 270 ºC and (b) 310 ºC respectively. Panels (c) and (d) show the charge and discharge curves for the 10th cycles of each.
Figure S9. Nyquist plots for O₂ annealed sample at varying potential.
