Experimental Section

General Procedures.
The synthesis was performed in 23 mL teflon-lined stainless steel container under autogenous pressure. Reagents were purchased commercially and used without further purification. Thermal analysis was carried out on a Netzsch STA449C thermal analyzer at a temperature range of 30 to 800 °C under nitrogen atmosphere with a heating rate of 10 ºC·min⁻¹. X-ray powder diffraction experiments were performed in a Rigaku Dmax 2500 instrument with an ultra 18Kw Cu rotating anode point source. Gas adsorption measurement was performed in the ASAP (Accelerated Surface Area and Porosimetry) 2020 System. Electron paramagnetic resonance (EPR) signals were recorded with a Bruker ESP 300E electron paramagnetic resonance spectrometer.
