Hybridization of graphene sheets and carbon-coated Fe₃O₄ nanoparticles as synergistic adsorbent of organic dyes †

Wei Fan, Wei Gao, Chao Zhang, Weng Weei Tjiu, Jisheng Pan and Tianxi Liu*

Electronic Supplementary Information

Figure S1. TEM images of Fe₃O₄@carbon sample.

Figure S2. TEM images of GFC190 hybrids prepared with different concentrations of graphene/Fe₃O₄ hybrids in glucose solution. (a) 1.25 mg/mL; (b) 5 mg/mL.

Figure S3. TGA curves of GO, SSG, Fe₃O₄, graphene/Fe₃O₄ and GFC190 hybrids. The experiments were performed under air flow from 100 to 800°C at a heating rate of 10°C/min.

Figure S4. N₂ adsorption/desorption isotherms of GFC10, GFC100, GFC190 and GFC380 hybrids.
