Supporting Information

Configurational Changes of Heme Followed of Cytochrome c

Folding Reaction

Jungkweon Choi*, a †, Dae Won Cho, b Sachiko Tojo, a Mamoru Fujitsuka, a and Tetsuro Majima*, a

a The Institute of Scientific and Industrial Research (SANKEN), Osaka University, Mihogaoka 8-1, Ibaraki, Osaka 567-0047, Japan.
b Department of Advanced Materials Chemistry, Korea University, Sejong Campus, Sejong 339-700, Korea.

† Present Address: Center for Nanomaterials and Chemical Reactions, Institute for Basic Science (IBS), Daejeon 305-701, Republic of Korea.
Figure S1. Steady-state Raman spectra of both ferric (a) and ferrous Cyt-c (b) in 0.5 and 4 M GdHCl solutions, respectively. ([Cyt-c] = 50 μM, λ_{Excitation} = 514 nm).
**Figure S2.** Peak analysis of the v2 mode of 1585 cm\(^{-1}\) for the unfolded ferric Cyt-c obtained with 416 nm excitation. The blue and red dotted lines denote the component spectra and the sum spectrum of all components, respectively.
