Figures in supporting information:

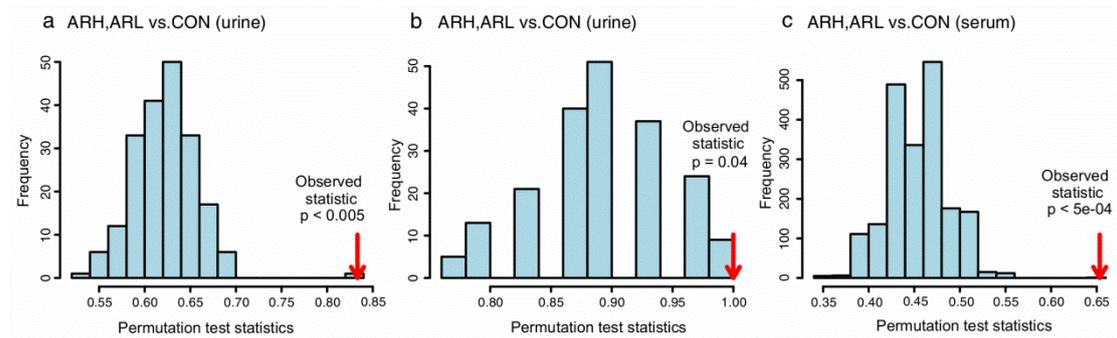

Figure S1 Histograms for permutation test scores of OSC-PLS-DA models for urine (a, b) and serum (c) of CON, ARL and ARH groups at all-time point (a, c) and on day 29 (b) after AR treatment on the basis of 200 permutations: the red arrows indicate the performance based on the original labels, significant for a p-value less than 0.05.

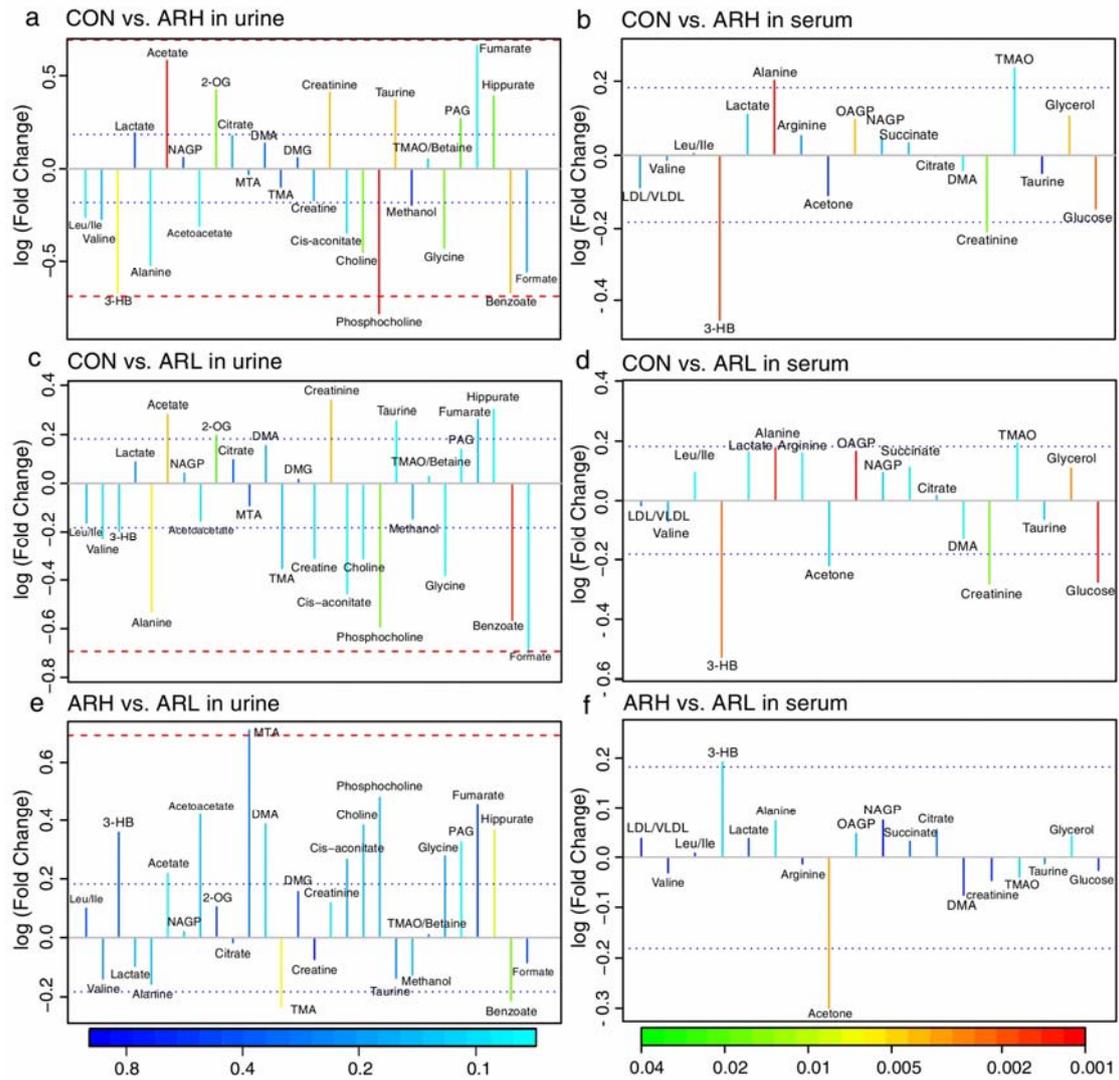

Figure S2 Fold change plots color-coded with p-values adjusted by Benjamini-Hochberg method indicating significance of altered metabolites in urine (a, c, e) and serum (b, d, f) of CON rats vs. ARH rats (a, b), CON rats vs. ARL rats (c, d) and ARH rats vs. ARL rats (e, f) on day 29 after AR treatment. The blue and red dashed lines represented variations of 20% and 100%, respectively. Metabolites abbreviation: Leu/Ile: Leucine/Isoleucine; 3-HB: 3-Hydroxybutyrate; NAGP: N-Acetyl Glycoproteins; 2-OG: 2-oxoglutarate; MTA: Methylamine; DMA: Dimethylamine; TMA: Trimethylamine; DMG: N, N-Dimethylglycine; PAG: Phenylacetyl glycine; OAGP: O-Acetyl Glycoproteins; TMAO: Trimethylamine N-oxide.

Table legend:**Table S1** Analysis of normality of urinary metabolites distribution by Shapiro-Wilk normality test in CON, ARH and ARL groups

| Metabolites | CON | ARH | ARL |
