1. **General methods used in synthesis**

Commercially available starting materials and reagents were used without further purification. Reactions requiring dry conditions were performed under an atmosphere of nitrogen using oven-dried glassware. Dichloromethane was dried over CaH$_2$ and methanol over magnesium. Solvents were purified by distillation prior to use. Reaction monitoring was performed by TLC on silica gel F$_{254}$ (Merck) or RP-18 (Merck) plates, detection was achieved by UV light and/or by treatment of the plates with 10 % sulfuric acid in EtOH, or with molybdophosphoric acid solution (1.5 g molybdophosphoric acid in 40 mL sulphuric acid and 500 mL water/EtOH), or with cerium sulfate solution (5 g cerium (IV) sulfate and 12.5 g molybdophosphoric acid in 40 mL sulphuric acid and 500 mL water/EtOH) and subsequent heating. Flash chromatography was performed on Merck silica gel 60 (0.040–0.063 mm).

For NMR spectroscopy, Bruker DRX 500 or AV 600 instruments were used. Chemical shifts ($\delta$) were calibrated relative to the internal solvent. For complete assignment the following two-dimensional NMR techniques were used: $^1$H–$^1$H COSY, $^1$H–$^{13}$C HSQC and $^1$H–$^{13}$C HMBC. ESI-MS measurements were performed on a Mariner instrument (ESI-ToF 5280 Applied Biosystems), MALDI-ToF mass spectra were recorded with a Bruker Biflex III instrument with 19 kV acceleration voltage and an ionization laser at 337 nm; 4-chloro-α-cyanocinnamic acid (Cl-CCA) was used as a matrix. Optical rotation values were measured on a Perkin-Elmer 241 polarimeter (10 cm cells, sodium D-line: 589 nm) and are averaged from five measurements. Elemental analyses were carried out with a EuroEA Elemental Analyzer from EuroVector. IR spectra were recorded on a Perkin-Elmer Paragon 1000 FT-IR spectrometer. For sample preparation a Golden Gate-diamond-ATR unit with a sapphire stamp was used.
2. General synthetic procedures

2.A Glycosylation using the trichloroacetimidate method

The glycosyl acceptor (1-octanol, 1-2.1 eq.) and the corresponding glycosyl trichloroacetimidate (1-1.2 eq.) were dried at least 1 h under vacuum. The reactants were dissolved in anhydrous dichloromethane (1 mL / g glycosyl donor) under nitrogen atmosphere. After adding molecular sieves (4 Å, 500 mg) the solution was cooled to 0 °C and BF₃∙Et₂O (1.7-4.5 eq.) was added dropwise over a period of 30 min. After stirring for 30 min at 0 °C the reaction mixture was stirred overnight at ambient temperature. The reaction mixture was washed with satd. NaHCO₃ and water. The aqueous phase was extracted with dichloromethane (three times). The combined organic phases were dried over MgSO₄, filtered and concentrated under reduced pressure. The crude product was purified by silica gel chromatography.

2.B O-acetyl deprotection according to Zemplén and Pacsu

The protected O-glycoside was dissolved in anhydrous methanol and a freshly prepared solution of sodium methoxide (1 M solution in methanol, 200 μL) was added. The mixture was stirred overnight at ambient temperature, neutralized with Amberlite IR120 (H), filtered and the solvents were evaporated to dryness. The substrate was dissolved in water and subjected to lyophilization.

2.C Fischer glycosylation with acetyl chloride

The glycosyl acceptor (1-octanol, 32 eq.) was used as solvent and cooled to 0 °C. Acetyl chloride (2.5 eq.) was added and the solution was stirred at 0 °C for 1 h. The monosaccharide was added in portions and the reaction mixture was stirred at 85 °C for 4.5 h. After cooling to room temperature the mixture was neutralized with Na₂CO₃ and filtered over Celite. The residue was washed with ethyl acetate. The organic phase was dried over MgSO₄ and concentrated under reduced pressure. The crude product was purified by silica gel chromatography.

2.D General procedure for O-acetylation with acetic anhydride in pyridine

The compound for O-acetylation was dissolved in pyridine (10 mL / g) and acetic anhydride was added dropwise. The reaction mixture was stirred at ambient temperature overnight. Then the solvent was evaporated to dryness. The residue was codestilled with toluene three times. The resulting crude product was purified by silica gel chromatography.
3. Synthetic procedures and analytical data

Octyl (2,3,4,6-tetra-O-acetyl)-α-D-mannopyranoside

According to the general procedure 2.A, 1-octanol (680 mL, 4.32 mmol), mannosyl trichloroacetimidate \(^4\) (2.55 g, 5.19 mmol, 1.2 eq.) and BF\(_3\)-Et\(_2\)O (3.10 mL, 19.4 mmol, 4.5 eq) were allowed to react in dichloromethane (25 mL). The crude product was purified by silica gel chromatography (cyclohexane / ethyl acetate, 2:1) yielding the acetylated 1,2-trans glucoside (916 mg, 1.99 mmol, 46 %) as colourless oil.

**Figure S1:** Representative ITC curve of octyl α-d-mannopyranoside (1) to determine the \(c_{mc}\) and \(\Delta H^\text{demic}\) in water at 25°C.

- \(c = 123\ \text{mmol}\cdot\text{L}^{-1}\)
- 70 aliquots a 4 µL
- \(c_{mc} = 9.8\ \text{mM}\)
**Figure S2**: Representative ITC curve of octyl β-D-mannopyranoside (2) to determine the cmc and ΔH° demic in water at 25°C.

\[
c = 259 \text{ mmol}\cdot\text{L}^{-1}
\]

85 aliquots a 3 µL

\[
cmc = 22.9 \text{ mM}
\]

**Figure S3**: Representative ITC curve of octyl α-D-galactopyranoside (3) to determine the cmc and ΔH° demic in water at 25°C.

\[
c = 189 \text{ mmol}\cdot\text{L}^{-1}
\]

95 aliquots a 3 µL

\[
cmc = 29.7 \text{ mM}
\]

Figure S8: Representative ITC curve of a binary glycomicelle containing octyl α-D-galactopyranoside (3) and octyl α-D-glucopyranoside (5) to determine the \( \text{cmc} \) and \( \Delta H^\circ \text{demic} \) in water at 25°C.

\[ c = 189 \text{ mmol-L}^{-1} \text{ (ratio 1:1)} \]

95 aliquots a 3 \( \mu \text{L} \)

\( \text{cmc} = 25.6 \text{ mM} \)

Figure S9: Representative ITC curve of a binary glycomicelle containing octyl β-D-mannopyranoside (2) and octyl β-D-glucopyranoside (6) to determine the \( \text{cmc} \) and \( \Delta H^\circ \text{demic} \) in water at 25°C.

\[ c = 250 \text{ mmol-L}^{-1} \text{ (ratio 1:1)} \]

95 aliquots a 3 \( \mu \text{L} \)

\( \text{cmc} = 23.3 \text{ mM} \)
Figure S10: Representative ITC curve of a binary glycomicelle containing octyl β-D-mannopyranoside (2) and octyl β-D-galactopyranoside (72) to determine the cmc and ΔH°demic in water at 25°C.

c = 250 mmol·L⁻¹ (ratio 1:1)
95 aliquots a 3 µL
cmc = 24.5 mM

Figure S11: Representative ITC curve of a binary glycomicelle containing octyl β-D-galactopyranoside (4) and octyl β-D-glucopyranoside (6) to determine the cmc and ΔH°demic in water at 25°C.

c = 238 mmol·L⁻¹ (ratio 1:1)
95 aliquots a 3 µL
cmc = 31.5 mM

**Figure S12:** Parameters employed for the pulsed gradient spin echo (PGSE) NMR experiment: duration time $\delta$ of the pulsed gradient $G$ and time $\Delta$ (diffusion time) between the leading edges of the pulsed gradients. $\tau$ represents the first and the second period of the experiment.

For determination of the diffusion coefficients, four regions in the $^1$H NMR spectra of the investigated compound were used ($\delta = 4.00-3.30, 1.65-1.37, 1.36-1.00$, and $0.90-0.60$ ppm).
