**Experimental**

**General information**

Melting points of all synthesized compounds were taken in a Riechert Thermover instrument and are uncorrected. The IR spectra (KBr) were recorded on Perkin Elmer RXI spectrometer. $^1$H NMR and $^{13}$C NMR spectra were recorded on a Bruker DRX-300 and Bruker Avance II 400 spectrometer using tetramethylsilane (TMS) as an internal standard and DMSO-$d_6$/CDCl$_3$ as solvent. ESI-MS were recorded on a THERMO Finnigan LCQ Advantage max ion trap mass spectrometer having an ESI source. Elemental analyses (C, H and N) were conducted using the Elemental vario EL III elemental analyzer and their results were found to be in agreement with the calculated values. Chemicals were of commercial grade and used without further purification. The homogeneity of the compounds was checked by thin layer chromatography (TLC) on glass plates coated with silica gel G254 (E. Merck) using chloroform-methanol (3:1) mixture as mobile phase and visualized using iodine vapors. All acid catalyst such as perchloric-SiO$_2$, PEG-OSO$_3$H, Zn(L-proline)$_2$, sulfuric acid-SiO$_2$, P$_2$O$_5$/SiO$_2$, NaHSO$_4$-SiO$_2$, xanthan-OSO$_3$H and sulfamic acid-SiO$_2$ used in optimization study were synthesised by reported procedures and rest were commercially available. X-ray diffractograms (XRD) of the catalyst were recorded in the 20 range of 10-70° with scan rate of 4°/min on a Rigaku Minifax X- ray diffractometer with Ni-filtered Cu Kα radiation at a wavelength of 1.54060° A. The SEM-EDX characterization of the catalyst was performed on a JEOL JSM-6510 scanning electron microscope equipped with energy dispersive X-ray spectrometer operating at 20 kV. TG/DTA was obtained with DTG-60H, with a heating rate of 20 °C/min from 0 to 500 °C under N$_2$ atmosphere.

**Preparation of catalyst**

Cellulose-HClO$_4$ was prepared by the drop wise addition of perchloric acid (1.0 g, 10 mmol) to a magnetically stirred mixture of cellulose (5.0 g) in n-hexane (20 mL) at 0 °C during 2 h. After the addition was complete, the mixture was stirred for another 2 h. Then, the mixture was filtered,
washed with acetone (30 mL) and dried at room temperature to afford cellulose-HClO$_4$ as white powder (5.25 g).

**Back titration analysis of Cellulose-HClO$_4$**

NaOH solution (20 mL, 0.1 N) was added to the Cellulose-HClO$_4$ (100 mg) in an Erlenmeyer flask. This solution was stirred for 10 min. Excess amount of base was neutralized by addition of HCl solution (1 N) to the equivalence point of titration. NaOH solution (20 mL, 0.1 N) when added to cellulose (100 mg) without HClO$_4$ and subjected to back titration under similar condition, no change in the strength of NaOH was observed. This ruled out the possible reaction of NaOH with cellulosic-OH groups.

**General procedure for the synthesis of bis-pyran annulated heterocyclic scaffolds (4a-r) and dihydropyran[ε]chromene scaffolds (4s-u) under solvent-free conditions**

A mixture of terephthaldehyde/isophthaldehyde (1a-b) (1.00 mmol), substituted benzaldehydes (1c-e, 1.00 mmol), ethyl cyanoacetate/malononitrile (2a–b) (2.00/1.00 mmol), a variety of C-H activated acids (3) (2.00/1.00 mmol) and cellulose-HClO$_4$ (0.08 g) were mixed in a 25 mL round bottom flask for the specific period of time (Table 4-7) at 70°C. After completion of the reaction (monitored by TLC), the reaction mixture was cooled to room temperature and added EtOAc (5 mL). The reaction mixture was filtered to recover the catalyst and then evaporated under reduced pressure to afford the product (4a-u). The products were further recrystallized from ethanol. The recovered catalyst was washed with EtOAc (2 mL x 2) dried in oven at 70 °C and reused for further catalytic cycles.
