Figure S1: Intensity of fluorescence of resorufin as a function of its concentration. Presented calibration curve was used to calculate concentration of the dye in its solutions from the measured intensities of fluorescence. The fluorescence intensity of resorufin (0-1.25 µM) was measured in triplicates.

Figure S2: Enzymatic activity of PBS aspirated from above the biocatalytic multilayers, containing a constant total number of polymer deposition steps and β-Gal deposited on top of 1, 3, or 5 bilayers of PSS/PAH, over one week. For assembly conditions and method of analysis see Main Text and Figure 3. Results are presented as average of three independent experiments ± standard deviation.
