I. SUPPLEMENTARY MOVIE 1 LEGEND

This movie shows the fastest rearrangement mechanism between a 20 particle Bernal spiral and a symmetrical cyclic structure, which is a kinetic trap on the energy landscape for 20 particles. The first four rearrangements along the pathway are low-energy ‘hinge’ motions.

II. SUPPLEMENTARY MOVIE 2 LEGEND

This movie shows the fastest pathway for inverting the chirality of a left-handed $N = 24$ helical structure. The rearrangement proceeds exclusively through low-energy ‘hinge’ motions.

III. SUPPLEMENTARY MOVIE 3 LEGEND

This movie shows the transformation of a 24-particle spiral into a highly symmetric ‘donut’-structure, which is the global minimum for this number of particles. The second rearrangement along the pathway has a high energy barrier, and corresponds to a change in dimerization pattern between the four particles at the lower end of the helix. All other motions are low-energy ‘hinge’ rearrangements.
