**Figure S1:** Size and zeta potential measurements of PEI/pDNA complexes in aqueous solutions (1 mL); pDNA (1 µg) was incubated with increasing amounts of PEI for 30 min at room temperature.

**Figure S2.** *In vitro* cytotoxicity of PEI/pDNA complexes. MTT assay data for cells and PEI/pDNA complexes at different ratios on the HEK cell culture.
Figure S3: High magnification of Figure 8B (right image), corresponding to DAPI staining of HEK cells after incubation for 4 h with LNC25-PTX-T (LNC concentration 500 µg/mL, PTX concentration 1 µg/mL). The red arrows point to fragmented nuclei.

Figure S4: Fluorescence images of HEK cells untreated (a) as negative control, and treated with LNC-T/pDNA loaded with DiI (100 µg/mL) (b) and DiO (100 µg/mL) (c). The scale bare represents 10 µm. The cells were fixed with 4% paraformaldehyde in PBS at room temperature for 15 min, stained with 0.1 µg/mL DAPI in PBS at room temperature for 15 min and washed twice with PBS and water.
Figure S5: High magnification of the Figure S4b (HEK cells treated with LNC-T/pDNA loaded with DiI (100 µg/mL) after 1 h (a) and 4 h (b) incubation.
