Fig. S1 (a) TEM and (b) HRTEM images of as-prepared TiO$_2$ microspheres.

S1
Fig. S2 Digital photograph of (A) as-prepared TiO\textsubscript{2} microspheres, (B) 200 °C calcined TiO\textsubscript{2} microspheres, and (C) 400 °C calcined TiO\textsubscript{2} microspheres, dispersed in water.
Fig. S3 1\textsuperscript{st} and 2\textsuperscript{nd} charge-discharge curves of (a) 200 °C calcined TiO\textsubscript{2} microspheres and (b) 400 °C calcined TiO\textsubscript{2} microspheres.
Fig. S4 Digital photograph of TiO₂ microspheres synthesized from one-pot synthesis. In one typical synthesis process, 2 ml of titanium isopropoxide could produce 502.8 mg of TiO₂ microspheres (after calcination at 400 °C for 2 hours), and the product yield is as high as ~96.1%.
Fig. S5 TEM image of 400 °C calcined TiO$_2$ microspheres after 100 charge-discharge cycles.
Fig. S6 HRTEM images of 200 °C calcined TiO$_2$ microspheres after cycling for (a) 1 cycle and (b) 100 cycles, and 400 °C calcined TiO$_2$ microspheres after cycling for (c) 1 cycle and (d) 100 cycles. The interplanar distances are all 0.35 nm corresponding to the spacing between the (101) planes of tetragonal anatase.
