Monomeric and dendritic ethacrynic acid derivatives

The syntheses were carried out using standard high vacuum and dry-argon techniques. All chemicals were purchased from Acros, Aldrich, Fluka, and used without further purification. The solvents were freshly dried and distilled according to standard procedures prior to use.

\( ^1\text{H}, ^{13}\text{C}, \) and \( ^{31}\text{P} \) NMR spectra were recorded with Bruker AV300, DPX300, AV400, spectrometers. All \( ^{13}\text{C} \) NMR and \( ^{31}\text{P} \) NMR spectra were generally recorded decoupled \( ^1\text{H} \). Fourier transformed infrared (FTIR) spectra were obtained with a Perkin–Elmer Spectrum 100 FT-IR spectrometer on neat samples (ATR FT-IR) or in solutions. Mass spectrometry was carried out with a Thermo Fisher DS QII (DCI/NH\textsubscript{3} or DCI/CH\textsubscript{4}).

**Procedure:** To a mixture of tyramine (136 mg, 1 mmol) and ethacrynic acid (300 mg, 1 mmol) in dry DMF (8 mL) were added at room temperature EDCI (230 mg, 1.2 mmol) and a catalytic amount of DMAP. The reaction mixture was stirred overnight at room temperature. Ethyl acetate (150 mL) was added and the organic layer was washed with water (2 × 50 mL) and brine (3 × 50 mL), dried over anhydrous MgSO₄ and then concentrated under reduced pressure. The crude product was purified by flash chromatography (DCM/EtOAc 90:10 to 80:20) to give the desired compound 13 as a white powder.

**Synthesis of 14**

**Procedure:** To a mixture of phenolpiperazine (190 mg, 1.07 mmol) and ethacrynic acid (307 mg, 1.01 mmol) in dry DMF (6 mL) were added at room temperature EDCI (230 mg, 1.2 mmol) and a catalytic amount of DMAP. The reaction mixture was stirred overnight at room temperature. Ethyl acetate (150 mL) was added and the organic layer was washed with water (2 × 50 mL) and brine (3 × 50 mL), dried over anhydrous MgSO₄ and then concentrated under reduced pressure. The crude product was purified by flash chromatography (DCM/EtOAc 90:10 to 80:20) to give 14 as a yellow powder.

**Synthesis of 15, 16 and 17.**

**General procedure**

A dendrimer Gn (100 mg, 0.055 mmol, n=1), (100 mg, 0.021 mmol, n=2) or (100 mg, 0.01 mmol, n=3), was dissolved in THF (20 ml), and then appropriate masses of phenol 14 (321 mg, 0.693 mmol, n=1), (245 mg, 0.53 mmol, n=2) or (218 mg, 0.47 mmol, n=3), and cesium carbonate (430 mg, 1.32 mmol, n=1), (328 mg, 1.01 mmol, n=2), (312 mg, 0.96 mmol, n=3), were added. The reaction mixture was stirred overnight at room temperature, and then centrifuged. The solution was concentrated and precipitated two times in pentane/ Et$_2$O (9/1). The product was filtered and dried under vacuum to give 15 (generation 1), 16 (generation 2) or 17 (generation 3) as white powders.

**Synthesis of 20.**

**Procedure:** To a solution of 13 (200 mg, 0.47 mmol), in dry DCM (10 mL) were added triethylamine (109 µL, 79 mg, 0.78 mmol) and PSCl$_3$ (15 µL, 25 mg, 0.15 mmol). The reaction mixture was stirred overnight at room temperature and concentrated under reduced pressure. The crude product was purified by flash chromatography (DCM/EtOAc 62:40) to give 20 as a white powder.

**Synthesis of 21 and 22.**

**Procedure:** To a solution of 13 (108 mg, 0.26 mmol) or 14 (119 mg, 0.26 mmol) in dry DCM, (10 mL) were added triethylamine (68 µL, 50 mg, 0.5 mmol) and dichloroethylphosphate (14 µL, 20 mg, 0.12 mmol). The reaction mixture was stirred overnight at room temperature and concentrated under reduced pressure. The crude product was purified by flash chromatography (DCM/THF 90:10 to 80:20) to give 21 or 22 as white powders.

**Cell culture and proliferation assay.** The human cell line KB (nasopharyngeal epidermis carcinoma) was originated from the NCI. Cells were grown in D-MEM medium supplemented with 10% fetal calf serum, in the presence of penicillin, streptomycin and fungizone in 75 cm$^2$ flask under 5% CO$_2$. HL60 (promyelocytic leukemia) and EPC (carp epithelium) cells from ATCC were grown in complete RPMI-1640 medium. Cells were plated in 96-well tissue culture with dendrimers dissolved in DMSO (1% final volume). After 72 h exposure, MTS reagent (Promega) was added and incubated for 3 h at 37°C: the absorbance was monitored at 490 nm and results are expressed as the inhibition of cell proliferation calculated as the ratio [(1-(OD490 treated/OD490 control))×100]. For IC$_{50}$ determinations (50% inhibition of cell proliferation) experiments were performed in duplicate.
