Table of Contents:

Fig. S1: Silicon nanowires synthesized through thermal evaporation and condensation method via VLS mechanism.

Fig. S2: The fabrication procedures of in-situ TEM samples and the schematic illustration of the reaction device.

Fig. S3: EDS mapping of Mn silicide/Si/Mn silicide nanowire heterostructure.

Fig. S4: The plot of MnSi reaction length as a function of time in the Al₂O₃-coated Si nanowire.

Fig. S5: TEM image and High resolution TEM image of both conditions (Bare Si nanowire and Si nanowire coated with Al₂O₃).

Fig. S6: I-V measurement of single MnSi nanowire. The inset is the SEM image of MnSi NW which was measured.

Fig. S7: I-V measurement of the MnSi/Si/MnSi nanowire heterostructures depicted the Schottky-diode-like (SDL) behavior.

Supporting video-1: The video shows the dynamic growth process of MnSi at 500°C
Supporting video-2: The video shows the dynamic growth process of MnSi in Si/Al₂O₃ core-shell nanowire structure at 500 °C.

Supporting video-3: The video shows the high magnitude of the dynamic growth process of MnSi in Si/Al₂O₃ core-shell nanowire structure at 500 °C.
Silicon nanowires synthesized through thermal evaporation and condensation method via VLS mechanism in the horizontal three zone furnace. The morphology was demonstrated by JOEL-6500F field emission scanning electron microscope. The structural identification was examined by Cs-corrected STEM.

Fig. S1 (a) SEM image of the as-grown silicon nanowires. The inset shows the image of Si NWs with high magnification. (b) High-resolution TEM image of the Si NW. The inset is the corresponding fast fourier transform diffraction pattern, indicating the [100] zone axis and [011] growth direction.
To prepare the specimens for *in-situ* TEM observation, nanowire were dispersed onto Si$_3$N$_4$ (60nm) membrane by wet transport method. Then, coating the PMMA and e-beam lithography was carried out to define the pads where the Manganese was deposited by E-gun evaporator at the following step. After lift-off process, the reaction device fabrication was completed.

**Fig. S2** The fabrication procedures of *in-situ* TEM samples and the schematic illustration of the reaction device.
Fig. S3  EDS mapping of Mn silicide/Si/Mn silicide nanowire heterostructure.
Fig. S4  The plot of MnSi reaction length as a function of time in the Al$_2$O$_3$-coated Si nanowire.
Fig. S5  TEM images and High resolution TEM images of both conditions (Bare Si nanowire and Si nanowire coated with Al₂O₃). Only one phase, MnSi, was observed.
**Fig. S6**  I-V measurement of single MnSi nanowire. The inset is the SEM image of MnSi NW which was measured.
I-V measurement of the MnSi/Si/MnSi nanowire heterostructures depicted the Schottky-diode-like (SDL) behavior. The result shows that the current increases as the channel length decreases and according to the formula in fig. S5(d), we calculate the effective barrier height $\psi_B$ with a value of 0.42 eV.

Fig. S7  (a) Low magnitude TEM image of MnSi/Si/MnSi nano-heterostructures device. (b) and (c) show different channel lengths of 410 nm and 1.26 μm formed by solid-state reaction at 500 °C, respectively. (d) The electron transport property of MnSi/Si/MnSi nano-heterostructures device. (e) Band diagram of the MnSi/Si/MnSi nano-heterostructures
In-situ TEM videos of the dynamic reaction of the manganese silicide/Si/manganese silicide nanowire heterostructures.

Supporting video-1: The video shows the dynamic growth process of MnSi at 500 °C. This video shows that the formation of the first MnSi was formed at the surface of nanowire.

Supporting video-2: The video shows the dynamic growth process of MnSi in Si/Al₂O₃ core-shell nanowire structure at 500 °C. It suggests that the radial growth of MnSi starts from the center rather than from the edge of the nanowire.

Supporting video-3: The video shows the high magnitude of the dynamic growth process of MnSi in Si/Al₂O₃ core-shell nanowire structure at 500 °C. The curvature presented near the edge of Si/oxide interface during the growth process may due to the high surface energy of silicide/oxide interface. Thus, it would impede the formation of silicide.
