Figure S11. Autoradiograms of 20% denaturing PAGE, showing the cleavage kinetics of 5'-32P-labelled target RNA (14) by RNase H1 in the native AON (1)/RNA (14) and single, double and triple oxetane T modified AON (2-4)/RNA (14) hybrid duplexes. The kinetics of the control native 15mer AON (1) and double T AON (3) with 1 µM and RNA (14) with 0.1µM concentration, used for the calibration of the exact RNase H concentration, are also shown. PDE-Ladder: snake venom PDE ladder. Conditions of cleavage reaction: RNA (0.1 µM) and AONs (1 or 5 µM) in buffer, containing 20 mM Tris-HCl (pH 8.0), 20 mM KCl, 10 mM MgCl2 and 0.1 mM DTT at 21 ºC, 0.12 U of RNase H. Total reaction volume is 30 µl. (See Materials and Methods section for full experimental details.) Data on 9.4 and 7.4 mins for AON 4 and 7.4 min for AON 3 are blanked out because of defused spots on the gel, which could not be integrated.
