General experimental procedures

All chemicals were purchased from Sigma-Aldrich Canada Ltd., Oakville, ON. All solvents were HPLC grade and used as such, except for CH$_2$Cl$_2$ and CHCl$_3$, that were redistilled and THF, which was dried by distillation over Na/benzophenone. Organic extracts were dried over Na$_2$SO$_4$ and solvents removed under reduced pressure in a rotary evaporator. HPLC analysis was carried out with a high performance liquid chromatograph equipped with quaternary pump, automatic injector, and diode array detector (wavelength range 190 - 600 nm), degasser, and a Hypersil ODS column (5 µm particle size silica, 4.6 i.d.×200 mm), equipped with an in-line filter. Mobile phase A: 75% H$_2$O - 25% CH$_3$CN to 100% CH$_3$CN, for 35 min, linear gradient, and a flow rate 1.0 ml/min; B: 100% H$_2$O for 10 minutes, then linear gradient to 50% H$_2$O-50% CH$_3$CN for 15 minutes, flow rate 1 ml/min. Fourier transform IR spectra were obtained on Bio-Rad FTS-40 spectrometer in KBr. NMR spectra were recorded on Bruker Avance 500 spectrometers; for $^1$H (500 MHz), δ values were referenced as follows CDCl$_3$ (CHCl$_3$, 7.23 ppm), CD$_3$CN (CHD$_2$CN, 1.94 ppm), CD$_3$SOCD$_3$ (CD$_3$SOCHD$_2$, 2.50 ppm); for $^{13}$C (125 MHz) CDCl$_3$ (77.23 ppm), CD$_3$CN (1.39 and 118.69 ppm), CD$_3$SOCD$_3$ (39.51 ppm). Mass spectra (MS) were obtained on a VG 70 SE and Q Star XL Applied Biosystems mass spectrometers.
Synthesis of 8-methylbrassilexin (13a, Scheme 6). NaH (60% suspension in mineral oil, 17 mg, 0.5 mmol) was added to a solution of brassilexin (1, 44 mg, 0.25 mmol) in dry THF (2 ml) and the mixture was allowed to stir at room temperature. After 10 minutes, MeI (30 µl, 0.5 mmol) was added and stirring was allowed to continue for further 60 min at room temperature. The mixture was then diluted with 1 M HCl (20 ml) and extracted with EtOAc. The combined organic extract was dried, the solvent was evaporated and the residue was chromatographed (SiO₂, hexane-acetone, 5:1) to afford 8-methylbrassilexin (13a) as a brownish solid (47 mg, 100%). Synthesis of 8-acetylbrassilexin (13b, Scheme 6). Ac₂O (0.1 ml, 1 mmol) was added to a solution of brassilexin (1, 17 mg, 0.10 mmol) in pyridine (0.2 ml) and the mixture was stirred at room temperature. After 2 hours the reaction mixture was diluted with 1 M HCl and allowed to stand at 3 °C for 60 min. The precipitate was filtered off, was washed with water and allowed to dry to yield 8-acetylbrassilexin (13b) as a white solid (16 mg, 73%).
