Synthesis of pseudoephedrine resin 18

(1R, 2R)-2-Amino-1-phenyl-propan-1-ol (norpseudoephedrine) hydrochloride 6

To a stirred solution of (1S,2R)-norephedrine (20.6 g, 136.1 mmol, 1 eq.) and Et₃N (19.0 mL, 136.1 mmol, 1 eq.) in dry CH₂Cl₂ (100 mL) at 0 °C under argon was added dropwise via syringe a solution of benzoyl chloride (15.8 mL, 136 mmol, 1eq.) in dry CH₂Cl₂ (20 mL). An additional 20 mL CH₂Cl₂ was required to aid stirring of the resulting white emulsion which was stirred at room temperature for 3 h. The white precipitate was collected by Buchner filtration and washed with pet. ether. The filtrate was concentrated under reduced pressure to give a white solid. The solids were combined and recrystallised from EtOAc. The resulting material was dissolved in degassed THF (400 mL) and PPh₃ (39.1 g, 149 mmol, 1.25 eq.) added. The solution was degassed with N₂ for 20 min before addition of degassed diisopropylazadicarboxylate (DIAD) (29.4 mL, 149 mmol, 1.25 eq.) and the reaction stirred for 18 h. The solvent was removed under reduced pressure and the resulting residue treated with 1.1 M HCl (700 mL, 3M in H₂O) and heated to reflux for 120 h. The volume was reduced by half under reduced pressure and the mixture extracted with CH₂Cl₂ (3 × 200 mL). The aqueous phase was concentrated under reduced pressure (azeotroping with EtOH) and the resulting material triturated with EtOAc. The solid was collected by Buchner filtration and washed with acetone to give known

compound 6 as a white solid (20.4 g, 109 mmol, 80%). mp 169-172 °C; $[\alpha]_D^{20} = -21.6$ (c = 1.2 in H$_2$O), (lit$^1$ $[\alpha]_D^{20} = -41.8$ (c = 7.2 in H$_2$O)); $[\alpha]_D^{20}$ 179-181 °C; $\nu_{\text{max}}$ (neat) 3362, 2952, 2530, 3036, 1935, 1602, 1467, 1094, 1033 cm$^{-1}$; $^1$H NMR (400 MHz, DMSO-d$_6$) δ 0.96 (3H, d, J = 6.7 Hz, CH$_3$); 3.20-3.27 (1H, m, CHCH$_3$); 4.46 (1H, d, J = 8.6 Hz, CHO$_2$); 6.22 (1H, broad s, OH); 7.32-7.42 (5H, m, 5 Ar CH); 8.09 (3H, broad s, NH$_3$); $^{13}$C NMR (100 MHz, DMSO-d$_6$) δ 15.4 (CH$_3$); 52.6 (CHCH$_3$); 74.8 (CHO$_2$); 127.4 (2 Ar CH); 128.4 (Ar CH); 128.7 (2 Ar CH); 141.7 (Ar C).

A slowly stirred suspension of (1S,2S)-S-Merrifield bound-(2R)-2-benzyl-N-(3-sulfanyl-propyl)-3-cyclopentyl-N-(2-hydroxy-1-methyl-2-phenylethyl)-propionamide (431 mg, 0.82 mmol/g (max.), 1 eq.) and n-Bu₄NOH (2.0 mL, 40% w/w, 20eq.) in t-BuOH (2.0 mL), H₂O (2.0 mL) and THF (8 mL) was heated to reflux for 16 h. The reaction was cooled to room temperature, filtered and the resin washed with distilled THF (300 mL). The filtrate was concentrated under reduced pressure and partitioned between 0.5 M NaOH and Et₂O. The aqueous phase was extracted with Et₂O (2 × 20 mL) and acidified to pH ≤ 2 with 3N HCl. The acidic aqueous phase was extracted with Et₂O (2 × 25 mL), the organics washed with water, dried over Na₂SO₄ and concentrated under reduced pressure.

To a stirred solution of 23 (6 mg, 0.026 mmol, 1 eq.) in dry Et₂O (1 mL) at 0 °C under N₂ was added LiAlH₄ (2 mg, 0.052 mmol, 2 eq.) and the reaction stirred for 3 h. The reaction was quenched with ice water and extracted with Et₂O (3 × 2 mL). The combined organics were washed with brine (2 mL), dried over Na₂SO₄ and concentrated under reduced pressure to provide 22 (4 mg, 0.018 mmol, 71%) as a pale yellow oil in 87% enantiomeric excess determined by chiral GC analysis using a β-cyclodextrin column (100 °C, 5 min hold, 100-155 °C @ 0.1°C/min, 70 min hold, 155-200 °C at 5.0 °C/min, 10 min hold; major enantiomer eluted at 78.01 min).
(2R)-2-Methyl-1-(1-methyl-1H-imidazol-2-yl)-3-phenyl-propan-1-one 24$^\circ$ (from ent–18)

To a stirred solution of 1-methylimidazole (0.18 mL, 2.20 mmol, 6 eq.) and TMEDA (0.33 mL, 2.20 mmol, 6 eq.) in dry THF (2 mL) at –78 °C under N$_2$ was added $n$-BuLi (1.10 mL, 2.0 M in hexanes, 6 eq.) and the solution stirred for 3 h. The resulting 1-methyl-2-imidazoyllithium solution was added, via cannula, to a suspension of ent–20 (R= Me) (532 mg, 0.399 mmol, 1 eq.) in dry THF (8 mL) at –78 °C under N$_2$.
