General

Low resolution mass spectra were recorded on a Micromass Trio 200 spectrometer; high resolution mass spectra were recorded on a Kratos Concept IS spectrometer. Modes of ionisation were electron impact (EI), chemical ionisation (CI) using ammonia, or electrospray in positive or negative mode (ES±). For halogenated compounds, characteristic groups of peaks due to different isotopes were observed. Infrared spectra were recorded on a Genesis FTIR spectrometer as evaporated films (from deuterochloroform or dichloromethane) on sodium chloride plates. Nuclear magnetic resonance spectra were performed using deuterated chloroform (CDCl₃) as the solvent unless otherwise stated. Proton nuclear magnetic resonance spectra (¹H NMR) were recorded on a Varian INOVA Unity 500 and 300 (500 and 300 MHz) spectrometers. Residual non-deuterated solvent was used as the internal standard. Coupling constants (J) are quoted in Hertz (Hz). Carbon nuclear magnetic resonance spectra (¹³C NMR) were recorded on a Varian INOVA Unity 300 (75MHz) spectrometer. Flash column chromatography was carried out using Merck silica gel 60H (40-60 nm, 230-300 mesh). Thin layer chromatography (TLC) was carried out using plastic plates coated with Merck HF254/366 silica gel. All reagents and solvents were purified by standard techniques and reactions in non-aqueous solvents were carried out under an atmosphere of nitrogen or argon.
