Electronic Supporting Information

Experiments were conducted at the University of Bath unless otherwise stated.
* denotes experiments conducted at the University of Oxford.

Reactions were conducted under an inert nitrogen or argon atmosphere with dry solvents unless otherwise stated. Nitrogen and argon were passed through a Drierite® filled drying tube before use. Glassware was either oven-dried at >200 °C, and allowed to cool to room temperature under a positive nitrogen pressure or vacuum. Reagents were purchased from Sigma-Aldrich Chemical Co. Ltd., Acros Organics Ltd or Avocado, and used as supplied. The phosphine ligands were purchased from Aldrich chemical company or Strem chemicals, with the exception of those synthesised according to Hayashi1,2 and Buchwald.3 The following chemicals were distilled prior to use and stored over 4Å molecular sieves: triethylamine (dist. and stored over KOH), methanol (dist. magnesium), ethanol (dist. magnesium), iso-propanol (dist. Magnesium) tert-butanol (dist. magnesium). 'Petrol' refers to petroleum ether fraction in the boiling range 40-60 °C. 4Å molecular sieves were activated by drying in an oven at >150°C. HPLC was performed on either an Agilent 1100 Series or Dionex P680 HPLC with detection at 254 nm, using OD-H and OJ-H columns and with a flow rate of 0.50-1.00 mL/min of hexane/iso-propanol (approx 99.8:2) after 30 minutes equilibration time.
General Information for Experiments Conducted at the University of Oxford

Tetrahydrofuran, purchased from Rathburn (HPLC grade), was distilled from Na/benzophenone and stored over 4Å molecular sieves prior to use. Diethyl ether, dichloromethane and toluene were collected fresh from an Innovative Technology Inc. PS-400-7 solvent purification system having been passed through anhydrous alumina columns. Thin layer chromatography was performed using aluminium backed silica plates (Merck Kieselgel 60 F\textsubscript{254}). Flash column chromatography was carried out using Zeochem ZEOprep hyd. 40-63 micron silica with pre-absorption of the crude product onto silica. \textsuperscript{1}H and \textsuperscript{13}C nuclear magnetic resonance experiments were carried out using a Bruker AVC-500 MHz NMR spectrometer. Chemical shifts were reported in parts per million from the residual solvent peak. Chemical shifts (δ) are given in parts per million (ppm) and coupling constants (J) in Hertz (Hz). Proton multiplicity is assigned using the following abbreviations: singlet (s), doublet (d), triplet (t), quartet (q), septet (sep), multiplet (m), broad (br) and apparent (app.). Where required, proton assignment was achieved using 2D NMR spectroscopy techniques, predominantly COSY and HMQC spectroscopy.

Melting points were determined using a Leica Galen III hot-stage microscope and are reported uncorrected. Infrared measurements were carried out using a Bruker Tensor 27 FT-IR with internal calibration in the range 4000-600 cm\textsuperscript{-1}. Accurate mass measurements were carried out on a Bruker MicroTOF mass spectrometer by the internal service at the Department of Organic Chemistry, University of Oxford.

General Information for Experiments Conducted at the University of Bath

Anhydrous tetrahydrofuran was collected fresh from an Innovative Technologies ‘Grubbs Apparatus’ solvent purification system.\textsuperscript{4} Thin layer chromatography was performed using Merck or Macherey-Nagel aluminium backed plates coated with a 0.20 mm layer of silica gel 60 with fluorescent indicator UV\textsubscript{254}. Flash column chromatography was carried out using Davisil LC 60Å silica gel (35-70 μm) purchased from Fluorochem, and samples were pre-absorbed on silica. \textsuperscript{1}H and \textsuperscript{13}C NMR spectra were recorded either a Bruker Avance 400 spectrometer (at 400.1 and 100.6 MHz respectively) or a Bruker Avance AC-300 spectrometer (300.2 and 75.5 MHz respectively) in CDCl\textsubscript{3} with trimethylsilane
(TMS) ($\delta_H$ 0 ppm) and/or the residual solvent as internal standards. Proton multiplicities were assigned as previously described.

Melting points were determined on a Buchi 535 melting point apparatus and are reported un-corrected. Infra-red spectra were recorded on a Perkin-Elmer 1600 Series FT-IR spectrometer with an internal background calibration in the range 4000-600 cm$^{-1}$. Mass spectroscopy, including high resolution spectra, were recorded by the EPSRC National Mass Spectrometry Service Centre, Swansea or at the Mass Spectrometry Service, University of Bath, using either electron impact (EI), chemical ionisation (CI) or electrospray (ES) techniques. Analyses were performed in positive ionisation mode. For low resolution measurements ammonia was used as the CI reagent gas on a Micromass Quantro II triple quadrupole. Elemental analyses were performed by the microanalysis service at the Department of Chemistry at the University of Bath, using an Exeter Analytical Inc CE-440 elemental analyser.
General procedure A: The preparation of 2,2-dialkyl-1,3-cyclic diketones

To a stirred solution of 2-methyl-1,3-cyclic diketone (39.7 mmol) and tetrabutyl ammonium hydroxide (40% w/w in water, 27.0 mL, 41.6 mmol) in dioxane (30 mL) was added alkyl bromide (60.3 mmol). The reaction was stirred at room temperature for 24 h, then 1M HCl\(_{\text{(aq)}}\) (200 mL) and ethyl acetate (100 mL) were added. The layers were partitioned and the aqueous layer extracted with ethyl acetate (2 × 100 mL). The organic portions were combined and washed with water (100 mL) and brine (100 mL), dried (MgSO\(_4\)), filtered and concentrated under reduced pressure to produce an orange oil which was purified by flash chromatography (solvents as stated).

2-Benzyl-2-methyl-cyclohexane-1,3-dione (ditriflate 10 precursor)

![2-Benzyl-2-methyl-cyclohexane-1,3-dione](image)

Prepared using general procedure A from 2-methyl-1,3-cyclohexanedione (5.0 g, 39.7 mmol) and benzyl bromide (8.39 mL, 60.3 mmol) and purified by flash chromatography (hexane:EtOAc 3:1) to yield the diketone (5.30 g, 62%) as white crystalline needles; \(\delta_H\) (300 MHz, CDCl\(_3\)) 7.28-7.16 (3H, m), 7.04-6.99 (2H, m), 3.11 (2H, s), 2.60-2.48 (2H, m), 2.35-2.23 (2H, m), 1.80-1.67 (1H, m), 1.55-1.42 (1H, m), 1.28 (3H, s); \(\delta_C\) (75 MHz, CDCl\(_3\)) 211.8, 137.1, 130.3, 128.8, 127.4, 65.7, 44.3, 39.7, 22.5, 17.0. Data consistent with literature.\(^5\)

General procedure B: The preparation of 2,2-dialkyl-1-alkenyltriflate-3-cyclohexanones

A stirred solution of 2,2-dialkyl-1,3-cyclohexanedione (0.93 mmol) and 2,6-di-tert-butyl-4-methylpyridine (418 mg, 2.04 mmol) in anhydrous DCE (5 mL) was cooled to 0°C. To this was added trifluoromethanesulfonic anhydride (0.33 mL, 1.94 mmol), dropwise. The reaction was then heated at 80°C for 18 h, after which it was allowed to cool to room
temperature. Diethyl ether (40 mL) was added, and the white pyridinium triflate salt was removed by filtration, washing with diethyl ether. The filtrate was concentrated under reduced pressure to produce a dark oil which was purified by flash chromatography (solvents as stated).

**General procedure C: The preparation of 2,2-dialkyl-1,3-cyclohexadienyl bis-alkenyltriflates**

A stirred solution of 2,2-dialkyl-1-alkenyltriflate-3-cyclohexanone (0.64 mmol) and 2-$[N,N$-bis(trifluoromethanesulfonyl)amino]-5-chloropyridine (0.30 g, 0.77 mmol) in anhydrous THF (10 ml) was cooled to -78°C. To this was added potassium hexamethyldisilazide (0.5M in toluene, 1.53 mL, 0.77 mmol), dropwise over 15 minutes. The reaction was stirred at -78°C for 2 h, then warmed to room temperature and stirred for a further 4 h. The mixture was then diluted with hexane (30 mL), and washed with water (20 mL), 10% NaOH$_{\text{aq}}$ (20 mL) and brine (20 mL). The organic phase was dried (MgSO$_4$), filtered and concentrated under reduced pressure to produce a dark oil which was purified by flash chromatography (solvents as stated).
Trifluoro-methanesulfonic acid 6-benzyl-6-methyl-5-trifluoromethane sulfonyloxy-cyclohexa-1,4-dienyl ester, 10

Prepared using general procedure C from the corresponding mono-alkenyltriflate (223 mg, 0.64 mmol) and purified by flash chromatography (hexane:EtOAc 10:1) to yield bis-alkenyltriflate 10 (227 g, 74%) as white needles. mp 89-91°C (hexane) $\nu_{\text{max}}$ (film)/cm\(^{-1}\) 3054 (C-H), 2987 (C-H), 1673 (C=C), 1418 (O-SO\(_2\)), 1141 (SO\(_2\)); $\delta_H$ (400 MHz, CDCl\(_3\)) 7.29-7.21 (3H, m), 7.10-7.06 (2H, m), 5.69 (2H, dd (app.t), J 3.9 and 3.5), 2.87 (2H, s), 2.76 (1H, dt, J 22.8 and 3.9), 2.33 (1H, dt, J 22.8 and 3.5), 1.55 (3H, s); $\delta_C$ (100 MHz, CDCl\(_3\)) 147.7, 135.0, 130.1, 128.5, 127.4, 114.2, 45.9, 42.1, 24.5, 23.1.
