General experimental details:

All solvents were distilled prior to use and stored under argon. $^1$H NMR spectra were recorded on a Bruker Avance DPX-400 spectrometer with residual solvent as the internal reference. $^{13}$C NMR spectra were also recorded on the same spectrometer with the central peak of the residual solvent as the internal reference using the deuterated solvent signal as the internal lock. IR spectra were recorded on a Perkin–Elmer SpectrumOne FT-IR spectrometer neat. Letters in the parentheses in the IR refer to relative absorbency of the peak: w, weak, $<40\%$ of the main peak; m, medium, 41–74% of the main peak; s, strong, $>74\%$ of the main peak. LC/MS analysis was performed on an Agilent HP 1100 chromatograph (Luna Max RP column) attached to an HPLC/MSD mass spectrometer. Elution was carried out using a reversed-phase gradient of MeCN/water with both solvents containing 0.1% formic acid. For HRMS an LCT Premier Micromass spectrometer was used.
