General information

$^1$H NMR spectra were recorded on Bruker instruments (600 MHz, or 400 MHz). Chemical shifts are reported in ppm with tetramethylsilane as internal standard. Data are reported as follows: chemical shift, multiplicity ($s$ = singlet, $d$ = doublet, $t$ = triplet, $q$ = quartet, $m$ = multiplet), coupling constants (Hz), integration. $^{13}$C NMR data were collected on Bruker instruments (150, or 100 MHz) with complete proton decoupling. Chemical shifts are reported in ppm with tetramethylsilane as internal standard. IR spectra were recorded on a Perkin-Elmer FT-IR spectrometer. Elemental analyses were performed on a CARLO ERBA–1106 apparatus. High-resolution mass spectra were obtained on a Bruker Daltoics Bio TOF–Q mass spectrometer (ESI, MALDI-TOF). GC–MS were measured on Agilent Technologies 6890-5973N. Flash column chromatography was performed with silica gel (300–400 mesh). All reactions were carried out under an argon atmosphere. Commercially available materials were used without further purification unless otherwise noted.

Preparation of hydrazines

Monosubstituted arylhydrazines were prepared from corresponding amines. $^1$N-Alkyl-$N$-arylhydrazines were prepared from corresponding monosubstituted arylhydrazines. $^2$ $N,N$-Diarylhydrazines$^3$ and $N,N$-dialkylhydrazines$^4$ were prepared from corresponding secondary amines. $N$-Acyl-$N$-arylhydrazines were prepared from corresponding $N$-arylamines.$^5$
