General Methods

Unless otherwise stated, all the chemicals and reagents were obtained commercially. Acetonitrile was dried by distilling over calcium hydride and kept it over 4 Å mol sieves, prior to use. Chromatography was done on pre-coated silica gel plates. Column chromatographic purifications were done with 100-200 Mesh Silica gel. NMR spectra were recorded in CDCl$_3$ on Ac 200 MHz or DRX-500 MHz NMR spectrometers. All chemical shifts are reported in $\delta$ ppm downfield to TMS and peak multiplicities are reported as singlet (s), doublet (d), quartet (q), broad (br), broad singlet (bs) and multiplet (m). IR spectra were recorded in nujol or CHCl$_3$. Single crystal X-ray data were collected with graphite monochromatized (Mo $K_\alpha = 0.71073\text{Å}$) radiation at room temperature. All the data were corrected for Lorentzian, polarization and absorption effects using SAINT and SADABS programs. SHELX-97 was used for structure solution with full matrix least squares refinement on $F^2$. Hydrogen atoms were included in the refinement as per the refinement model.
