SI8. ^1H NMR (298K, 300 MHz) complexation studies of Imi in CDCl_3 in presence of water

^1H NMR (298K, 300MHz) spectra of $\mathbf{3} \cdot \mathbf{H}^+$ with Imi (1.6 equiv.) in CDCl_3 in the presence of a) 3 equiv.; b) 10 equiv.; c) 19 equiv.; S: solvent; W: water; ●: mixture of $\mathbf{3} \cdot \mathbf{H}^+$ and $\mathbf{3} \cdot \mathbf{H}^+ \supset \text{nH}_2\text{O}$.

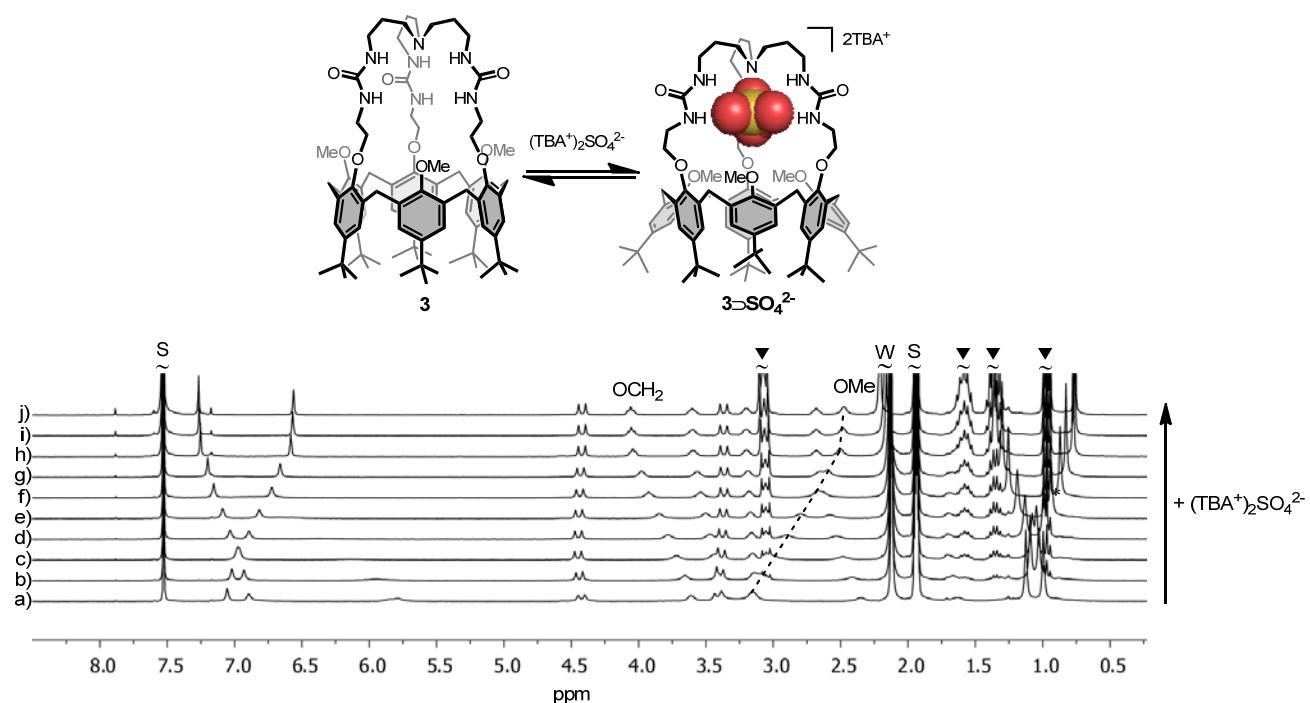

This NMR study clearly shows that $\mathbf{3} \cdot \mathbf{H}^+$ bounds water. Note that the chemical shifts of the NMR signals corresponding to the protonated calixarene species that do not include Imi (i.e.: ●) are modified upon the addition of water. This result can be rationalized by the fact that these signals correspond to a mixture of $\mathbf{3} \cdot \mathbf{H}^+$ and $\mathbf{3} \cdot \mathbf{H}^+ \supset \text{nH}_2\text{O}$, the exchange process between these two species being fast on the NMR time scale.
