Supplementary Methods

General methods. Synthesis and characterization of monomers are in the online Supplementary information. All the starting materials were obtained from Adamas or Sangon Biotech. Commercially available reagents were used without further purification, unless noted otherwise. All other chemicals were reagent grade or better. HPLC analyses were performed on an Agilent 1200 HPLC system equipped with a G1322A pump and an in-line diode array UV detector using an Agilent Zorbax 300SD-C18 RP column with CH$_3$OH (0.1% of TFA) and water (0.1% of TFA) as the eluent. $^1$H NMR spectra were obtained on a 300 MHz Bruker AV 300. MALDI-TOF/TOF mass spectra were obtained on a time-of-flight Ultrflex II mass spectrometer (Bruker Daltonics). Dynamic light scattering (DLS) measurement was taken on a Zeta Sizer Nano Series (Malvern Instruments). Scan electron micrographs (SEM) were obtained on JEOL-JSM-6700F electron microscope at an accelerating voltage of 5.0 kV. Transmission electron micrographs (TEM) were obtained on a JEOL 2010 electron microscope, operating at 100 kV. The cryo-dried samples were prepared as following: a copper grid coated with carbon was dipped into the suspension and placed into a vial, which was plunged into liquid nitrogen until no bubbles were apparent. Then, water was removed from the frozen specimen by a freeze-drier.

Syntheses and Characterizations

The preparations of compound 1 and 2 were described as below; 2-cyano-6-aminobenzothiazole (CBT) was synthesized following the literature method (White, E. H., Worther, H., Seliger, H. H., McElroy, W. D. Amino analogs of firefly luciferin and biological activity thereof. J. Am. Chem. Soc. 1966, 88, 2015-2019).

The white emulsion was formed 5 mins later. MALDI-TOF mass analysis indicated that the majority of the oligomers are the dimers of 1 (e.g., 1-D-3). MS: calc.M$^+$=984.21, obsvd. MALDI-TOF MS: m/z 985.296 [(M+H)$^+$].
**Scheme S4.** Preparation of crosslinked polymer of 1-D-3.

**Scheme S5.** Degradation of polymers.

*Synthesis and characterization of crosslinked polymers of 1-D-3:* The oligomers of 1 was dissolved in methanol and applied on a HPLC column for separation. Main peaks on the HPLC trace were identified with MALDI-TOF mass analysis. The peak at the retention time of 25.7 min (1-D-3) was collected and evaporated at 50 °C to yield yellowish, polymeric powders.

*Reduction of crosslinked polymers of 1-D-3:* The polymers of 1-D-3 was partially reduced by TCEP to yield 1-D-3, as showed in scheme S5 and proved in figure 3d&e.
