**General procedure A**: Synthesis of homopropargylic alcohols via opening of ethylene oxide by terminal alkynes

To a cooled (-70 °C) solution of Li-amide (prepared from Li (60 mmol, 1.5 equiv.), 70 mL liquid ammonia and catalytic Fe(NO₃)₃, a solution of terminal alkyne (40 mmol, 1 equiv.) in dry diethyl ether (10 mL) was added dropwise with stirring. After additional stirring of 1h ethylene oxide (60 mmol, 1.5 equiv.) was added. The reaction mixture was stirred for 5-8h. After completion of the reaction as indicated by TLC, the reaction mixture was quenched with NH₄Cl. Ammonia was allowed to evaporate and the reaction mixture was diluted with 25 mL water and extracted with ether (3x25 mL). The organic extract was washed with brine (2x10 mL), dried over anhydrous Na₂SO₄ and concentrated in vacuo. The resulting crude product was purified by column chromatography (silica gel, 60-120 mesh) using ethyl acetate/n-hexane gradients to afford pure product.
