Experimental Section

**General:** THF was distilled from sodium benzophenone under nitrogen. All reactions were conducted under a nitrogen atmosphere. Metallic zinc and all solvents were purchased from commercial source, without further purification before use. The flash column chromatography was carried out on Merck silica gel (300–400 mesh). $^1$H and $^{13}$C NMR spectra were recorded on a Varian Mercury 400 MHz spectrometer as solutions in CDCl$_3$. Chemical shifts in $^1$H NMR spectra are reported in parts per million (ppm, δ) downfield from the internal standard Me$_4$Si (TMS). Chemical shifts in $^{13}$C NMR spectra are reported relative to the central line of the chloroform signal (δ = 77.50 ppm). High-resolution mass spectra were obtained with a GCT-TOF instrument.

**Materials:** All chemicals were purchased from Aldrich, Alfa or Acros chemical company and used thus, without further purification. Petroleum ether (PE) used refers to the 60–90 °C boiling point fraction of petroleum.

**General procedure for the synthesis of organozinc reagent:** Alkyl bromide (128 μL, 1.5 mmol) and zinc powder (0.1170 g, 1.8 mmol) in dry THF (3 mL) under a nitrogen atmosphere at room temperature. (for 4b and 4c, 5% I$_2$ was added to trigger the reaction.) The mixture was stirred for about 15 min, and zinc powder disappeared. The stirring was continued to 0.5 h. 2d and 2e were prepared according to Knochel's method. The concentration of organozinc reagents was determined by titration with I$_2$.

**General procedure for the olefination reaction:** A solution of organozinc reagent in THF (1.5 mmol) was added to a solution of carbonyl compounds (0.5 mmol) in dry THF (3 mL) under a nitrogen atmosphere at room temperature. The mixture was stirred for about 30 min. Then diphenyl phosphite (0.6 mmol) was added (the reaction was monitored by TLC). The reaction mixture was stirred for 5h at 50 °C and then was quenched with dilute hydrochloric acid. The resulting mixture was extracted with diethyl ether (3×10 mL), and dried over anhydrous Na$_2$SO$_4$. The solvent was removed by evaporation under reduced pressure. Purification by column chromatography on silica gel afforded olefins (300–400 mesh, petroleum ether and ethyl acetate as eluent).
