1. Structural studies

The relative configuration of azidopolyol 5 was secured through 1D and 2D NMR studies of isopropylidene acetal 15. As shown in the next Figure, _anti_-C3,C5 relationship was supported by \(^{13}\)C NMR whereas NOESY analyses confirm the 3,4-syn-4,5-anti configuration.

In turn, the configuration of pyranoses 8, 18, and 20 was established through 1D and 2D NMR studies. For instance, proton coupling constant pattern of deoxyaminosugar 8 is characteristic of a chairlike pyranose ring in which the C2 substituent is axial whereas the C3, C4, and C5 substituents are at the equatorial positions. This arrangement together with the analysis of diagnostic nOe interactions is consistent with the \(\alpha\) anomer of a mannopyranoside sugar. Similar studies on 18 and 20 established that they had been obtained as 65:35 and 40:60 mixtures of \(\alpha\) and \(\beta\) anomers respectively.

Furthermore, treatment of 20 with acetic anhydride afforded polyacetylated deoxyaminosugar 21 as a 40:60 mixture of diastereomers, whose \(^1\)H and \(^{13}\)C NMR peaks for the major anomer matched to the data reported in the literature for the \(\beta\) - 1, 2, 4-tri-O-acetyl-3-amino-N-benzylxycarbonyl-3,6-dideoxyglucopyranose.\(^1\)
