1. Materials and Methods.

General:

1-[bis(dimethylamino)methylene]-1H,1,2,3-triazolo-[4,5-b]pyridinium hexafluorophosphate 3-oxide (HATU), 1-[bis(dimethylamino)methylene]-1H-benzotriazolium hexafluorophosphate 3-oxide (HBTU), 1-[bis(dimethylamino)methylene]-1H-benzotriazolium tetrafluoroborate 3-oxide (TBTU), N,N'-Diisopropylcarbodiimide (DIC), N,N'-diciclohexilcarbodiimide (DCC), and 4-Dimethylaminopyridine (DMAP), alpha-amino acids were purchased from Novabiochem, Applied Biosystems, Aldrich or from Global Sales Manager, GL Biochem (Shanghai) Ltd, China. All reagents and solvents were used as received unless otherwise noted. CH₂Cl₂ and DIEA to be used as reaction solvents were distilled from CaH₂ over argon immediately prior to use. Tetrahydrofurane (THF) was dried and distilled over sodium/benzophenone. Analytical thin-layer chromatography was performed on E. Merck silica gel 60 F₂₅₄ plates. Compounds, which were not UV active, were visualized by dipping the plates in a ninhydrin solution and heating. Silica gel flash chromatography was performed using E. Merck silica gel (type 60SDS, 230-400 mesh). Solvent mixtures for chromatography are re-reported as v/v ratios. HPLC purification was carried out on phenomenex Luna 5u Silica 100 Angstroms column with CH₂Cl₂/MeOH gradients between 100 and 85:15 or on phenomenon Luna 5u C-18 100 Angstroms with H₂O (0.1% TFA)/CH₃CN (0.1% TFA) gradients between 5:95 and 75:25. ¹H NMR and ¹³C NMR spectra were recorded on Bruker AMX 500 MHz, Varian Mercury 300 MHz or Bruker WM 250 MHz spectrometers. Chemical shifts (d) were reported in parts per million (ppm) relative to tetramethylsilane (d=0.00 ppm) or by the deuterium solvent. ¹H NMR splitting patterns are designated as singlet (s), doublet (d), triplet (t), or quartet (q). All first-order splitting patterns were assigned on the basis of the appearance of the multiplet. Splitting patterns that could not be easily interpreted are designated as multiplet (m) or broad (br). ¹H NMR Assignments of Cyclic Peptides (CPs). The signals of the ¹H NMR spectra of the peptides in CDCl₃ were identified from the corresponding double-quantum-filled 2D COSY, TOCSY and/or NOESY and ROESY spectra acquired at concentration and temperature indicated (Mixing times for NOESY and/or ROESY -between 250 and 1000 ms- were not optimized). Carbon resonances were assigned using distortionless enhancement by polarization transfer (DEPT) spectra obtained with phase angles of 135. Fast Atom Bombardement (FAB) mass spectra were recorded on a Micromass Autospec mass spectrometer. Electrospray (ESI) mass spectra were recorded on a Bruker BIOTOF II mass spectrometer. Mass Spectrometry of Laser Desorption/Ionization-Time of Flight (MALDI-TOF) was obtained on a Bruker Autoflex mass

spectrometer. FTIR measurements were made on a JASCO FT/IR-400 spectrophotometer placing the sample on a CaF₂ pellet.
