General Information

All reagents were purchased from commercial sources and were used without further purification.

Unless otherwise stated, all procedures were carried out under an atmosphere of argon. Where necessary, solvents were dried on an MBraun SPS solvent purification system. Anhydrous THF was obtained by distillation over sodium benzophenone. Hexane refers to n-hexane and pet. ether refers to light petroleum ether, bp 40–60 °C.

Flash column chromatography was performed using Fluka silica gel 60 under positive pressure. Analytical thin layer chromatography was performed on aluminium sheets pre-coated with Merck silica gel 60 F$_{254}$ and visualised with ultraviolet light (254 nm), aqueous potassium permanganate or anisaldehyde solutions where appropriate.
$^1$H NMR spectra were recorded on a JEOL ECX 400 (400 MHz) instrument. The chemical shift data is reported in parts per million (ppm) on the delta ($\delta$) scale relative to tetramethylsilane (TMS) where $\delta_{\text{TMS}} = 0.00$ ppm. The number of protons (n) for a given resonance is indicated by $n\text{H}$. The multiplicity of each signal is indicated by: s (singlet), br s (broad singlet), d (doublet), t (triplet), q (quartet), m (multiplet). The coupling constants ($J$) are quoted to the nearest 0.5 Hz. The residual protic solvent (CHCl$_3$) ($\delta_{\text{H}}=7.26$ ppm) was used as an internal reference. $^{13}$C NMR spectra were recorded on a JEOL ECX 400 instrument at 100 MHz. The central signal of CDCl$_3$ ($\delta_{\text{C}}=77.0$ ppm) was used as an internal reference. $^{13}$C spectra were verified using DEPT experiments and COSY and HSQC experiments were used for assignment purposes where necessary. Chemical shifts are reported to the nearest 0.01 ppm for $^1$H NMR and to the nearest 0.1 ppm for $^{13}$C NMR.

Infrared spectra were carried out on a ThermoNicolet IR100 spectrometer and are recorded as a thin film between NaCl discs. Absorption maxima are reported in wavenumbers (cm$^{-1}$) and only selected absorbances are reported. Mass spectra and accurate mass measurements were obtained through the University of York mass spectrometry service and were recorded on a Bruker Daltonics, Micro-tof spectrometer. All melting points were taken on a Gallenkamp instrument.

All numbering of structures is for characterisation purposes only and does not conform to IUPAC rules.

Compounds $^3$3$^1$, $^4$4$^1$ and $^2$2$^2$ were made using literature procedures.

To a stirred solution of NaH (920 mg, 23.0 mmol, 60% dispersion in mineral oil) in DMF (150 mL) at 0 °C was added triisopropylsulfoxonium tetrafluoroborate (6.08 g, 23.0 mmol). This solution was allowed to stir for 5 mins before the drop-wise addition of a solution of diethyl fumarate (3.31 g, 19.2 mmol) in DMF (35 mL). The reaction mixture was allowed to stir at 0 °C for 5 mins before being warmed to RT and stirred...
for a further 2 h. It was diluted with Et\(_2\)O (115 mL), washed with sat. NH\(_4\)Cl (aq.) (100 mL), the organic layer separated and the aqueous layer extracted with further portions of Et\(_2\)O (2 x 150 mL). The combined organic extracts were dried (MgSO\(_4\)), filtered and concentrated under reduced pressure. The resulting crude product was purified by flash column chromatography on silica gel, eluting with pet. ether: Et\(_2\)O (7: 1 → 4: 1) to afford the title compound \(7\) as a colourless oil (3.01 g, 73%).

To a stirred solution of LiAlH\(_4\) (963 mg, 25.4 mmol) in THF (25 mL) at 0 °C was added a solution of \(7\) (3.63 g, 16.9 mmol) in THF (9 mL), over a period of 1 h via a dropping syringe. The reaction mixture was then refluxed at 70 °C for 2 h, before being cooled to RT and stirred for 18 h. After being cooled to 0 °C the mixture was diluted with EtOAc (6 mL), washed cautiously with sat. NH\(_4\)Cl (aq.) (6 mL). The resulting suspension was filtered, and the insoluble salts were washed with further portions of EtOAc (2 x 10 mL). The filtrate was concentrated under reduced pressure, and the residue taken up in EtOAc (10 mL). The solution was then dried (MgSO\(_4\)), filtered and concentrated under reduced pressure to afford the title compound \(8\) as a colourless oil (1.89 g, 86%).

To a stirred solution of 8 (934 mg, 7.17 mmol) in CHCl₃ (70 mL) was added manganese (IV) dioxide (12.4 g, 143 mmol) and (carbethoxymethylene) triphenyl phosphorane (5.99 g, 17.2 mmol). The resulting suspension was stirred vigorously with heating to maintain gentle reflux for 18 h. After cooling to room temperature, the suspension was filtered through Celite, and washed with CHCl₃ (25 mL). The filtrate was concentrated under reduced pressure to give the crude product. This was purified by flash column chromatography on silica gel, eluting with pet. ether:EtOAc (20:1) to afford the title compound 9a as a white solid (1.31 g, 69%), and 9b as a colourless oil (85 mg, 4%).

(2Z,2'Z)-Diethyl (±)-3,3'-((1R,2R)-3,3-dimethylcyclopropane-1,2-diyl)diprop-2-enoate (9c)

To a stirred solution of 8 (1.80 g, 13.8 mmol) in CHCl$_3$ (150 mL) was added manganese (IV) dioxide (24.0 g, 276 mmol). The suspension was refluxed gently and after 16 h, the suspension was filtered through Celite, and washed with CHCl$_3$ (250 mL). The filtrate was concentrated under reduced pressure to give (1.25 g, 72%) of dialdehyde. (195 mg, 1.55 mmol) of the resulting dialdehyde was diluted with THF (8 mL). This was added, via cannula, to a solution of ethyl [bis(2,2,2-trifluoroethoxy)phosphoryl]acetate (1.33 mg, 4.00 mmol), 18-crown-6 (2.34 g, 9.02 mmol) and KHMS (5.80 mL, 0.7 M in toluene, 3.45 mmol) at $-78^\circ$C. After 2 h the reaction was quenched with sat. NH$_4$Cl (aq.) (15 mL), Et$_2$O (25 mL) added and the organic layer separated. The aqueous layer was extracted with further portions of Et$_2$O (2 × 25 mL) and the combined organic extracts were dried (MgSO$_4$), filtered and concentrated under reduced pressure. The resulting crude product was purified by flash column chromatography on silica gel, eluting with pet. ether:EtOAc (10:1) to afford the title compound 9c as a colourless oil (144 mg, 35%).

Oxygen was bubbled through a solution of ethyl chrysanthemate (10.0 g, 0.0510 mmol) in CH₂Cl₂ (500 mL) at −78 °C for 5 min. Ozone was then bubbled through the solution until a sky blue colour could be seen (55 min), after which time oxygen was bubbled through the solution for a further 5 min. DMS (37.4 mL, 0.510 mmol) was next added to the solution, which was then allowed to stir at RT overnight. The
solution was concentrated under reduced pressure to give the crude product, which was purified by flash column chromatography on silica gel, eluting with pet. ether:EtOAc (10:1) to afford the title compound as a mixture of diastereomers (SI-3:SI-4 cis:trans 2:3) and as a colourless oil (8.23 g, 97%).

### Methyl (±)-(E)-3-((1R,3S)-3-((tert-butyldimethylsilyloxy)methyl)-2,2-dimethylecyclopropyl)prop-2-enoate (34)

To a stirred solution of **20** (200 mg, 0.818 mmol) in CHCl\(_3\) (8 mL) was added manganese (IV) dioxide (711 mg, 8.18 mmol) and (methoxycarbonylmethylenetriphenylphosphorane (328 mg, 0.982 mmol). The resulting suspension was stirred vigorously with heating to maintain gentle reflux for 48 h. After cooling to room temperature, the suspension was filtered through Celite, and washed with CHCl\(_3\) (20 mL). The filtrate was concentrated under reduced pressure to give the crude product. This was purified by flash column chromatography on silica gel, eluting with pet. ether:EtOAc (50:1) to afford the title compound **34** as a mixture of E/Z isomers in a ratio of 1:0.16 and as a colourless oil (118 mg, 48%).

**Methyl (±)-(E)-3-((1R,3S)-3-(hydroxymethyl)-2,2-dimethylcyclopropyl)prop-2-enoate (35)**

To a stirred solution of 34 (100 mg, 0.335 mmol) in MeCN (4 mL) in a plastic container was added HF (23 µL, 48 wt % in water, 0.531 mmol). This was stirred at RT for 16 h before the addition of sat. NaHCO₃ (aq.) (5 mL). The solution was diluted with CH₂Cl₂ (10 mL), the organic layer was separated and the aqueous layer extracted with further portions of CH₂Cl₂ (2 × 10 mL). The combined organic extracts were dried (MgSO₄), filtered and concentrated under reduced pressure to afford the title compound 35 as a colourless oil (50 mg, 81%), which was used in the next step without further purification.
