1. General:

All solvents were distilled prior to use. Petroleum ether refers to fraction boiling in the range 60-80 °C. DMF and DCM were dried over CaH₂, distilled, and stored over 3Å molecular sieves in sealed container. THF was distilled over sodium and benzophenone. All the reactions were carried out under argon atmosphere and anhydrous conditions unless otherwise noted. Analytical thin-layer chromatography (TLC) was performed on Silica gel 60 F₂₅₄ aluminium TLC sheets. Visualization of the developed chromatogram was performed by UV absorbance or iodine exposure. For purification, column chromatography was performed using 60-120 or 100-200 mesh silica gel.

¹H and ¹³C NMR spectra were recorded on a 300, 500 or 600 MHz spectrometer using tetramethylsilane (TMS) as internal standard. Chemical shifts (δ) are given from TMS (δ = 0.00) in parts per million (ppm) with reference to the residual nuclei of the deuterated solvent used [CDCl₃: ¹H NMR δ = 7.26 ppm (s), ¹³C NMR δ = 77.0 ppm]. Coupling constants (J) are expressed in hertz (Hz) and spin multiplicities are given as s (singlet), d (doublet), dd (double doublet), dt (double triplet), t (triplet), m (multiplet), and br (broad). All ¹³C NMR spectra were obtained with complete proton decoupling. Mass spectra were performed using ESI-TOF, EI or FAB ionization mode. Infrared spectra were obtained on FT/IR-4200 infrared spectrometer as neat sample or as KBr pellet.
2. X-Ray crystallographic informations of product 9c:

Single crystals of products 9c were obtained through slow evaporation (at room temperature) of a solution in dichloromethane-petroleum ether. A single crystal of 9c was attached to a glass fiber with epoxy glue and transferred to a Bruker SHELXL-97 X-ray diffractometer, equipped with a graphite-monochromator. Diffraction data of product 9c was measured with MoKα radiation (λ = 0.71073 Å) at 296(2)K. Computing cell refinement and data reduction was carried out at APEX 2 Bruker Kappa. The structure was solved by direct methods using the SHELXS-97 program.1 Refinements were carried out with a full matrix least squares method against \( F^2 \) using SHELXL-97.2 The non-hydrogen atoms were refined with anisotropic thermal parameters. The hydrogen atoms were included in geometric positions and given thermal parameters equivalent to 1.2 times those of the atom to which they were attached. The ORTEP diagram (Figure S1) and some important crystallographic data (Table S1) of compound 9c are given below.

The crystal data of product \textbf{9c} has already been deposited at Cambridge Crystallographic Data Centre. The CCDC reference number is 939088
3. Synthesis of starting substrates 7:

![Chemical structure of starting substrates 7a and 7b](image)

Scheme S1 Reagent and conditions: (i) ethynylmagnesium bromide, THF, 0 °C, 0.75 h, 62%; (ii) Et₃SiH, trifluoroacetic acid, DCM, 0 °C to rt, 2 h, 45%; (iii) LiAlH₄, THF, 0 °C, 2h, 75%; (iv) TsCl, pyridine, DCM, 0 °C to rt, 2h, 78%.

The starting substrates, i.e., 2-(prop-2-ynyl)aniline 7a and 2-(2-propynyl)tosylanilide 7b were prepared through a sequence of steps starting from *ortho*-azidobenzaldehyde (Scheme S1). The *ortho*-azidobenzaldehyde was first treated with ethynylmagnesium bromide, the resulting acetylenic carbinol was then undergone dehydroxylation followed by reduction to yield the product 7a. Finally, tosylation of amine 7a using tosyl chloride and pyridine in dry DCM led to the synthesis of compound 7b.

**Procedure for the synthesis of starting substrate 7a-b:**

To a solution of *ortho*-azido benzaldehyde (3.0 g, 20.39 mmol) in dry THF (30 mL) was added 0.5 M ethynylmagnesium bromide solution in dry THF (41 mL) dropwise at 0 °C under argon atmosphere and stirred for 45 minutes at the same temperature. After completion of reaction (TLC), the reaction mixture was quenched with saturated NH₄Cl solution at 0 °C. THF was evaporated under reduced pressure, and the resulting residue was extracted with ethyl acetate (3 × 50 mL). The combined organic extracts were washed with water (50 mL) and brine (50 mL), dried over anhydrous Na₂SO₄, filtered, and concentrated under reduced pressure. The crude product was purified through silica gel (100-200 mesh) column chromatography (ethyl acetate-petroleum ether) to afford the acetylenic carbinol (2.18 g, 62%).

To a solution of the acetylenic carbinol (3.0 g, 17.32 mmol) in dry DCM were added consecutively triethylsilane (5.53 mL, 34.64 mmol) and trifluoroacetic acid (5.3 mL, 69.28 mmol) at 0 °C under argon atmosphere and the reaction mixture was allowed to stir at room temperature. After completion of the reaction (TLC), the solvent was evaporated under reduced pressure; the resulting residue was dissolved in ethyl acetate (60 mL) and
the pH of the solution was adjusted to 7 by dropwise addition of aqueous NaHCO₃ solution. The mixture was then washed with water (30 mL), dried over anhydrous Na₂SO₄, and concentrated under reduced pressure. The crude product was purified by silica gel (100–200 mesh) column chromatography (ethyl acetate-petroleum ether) to afford 2-(2-propynyl)azidobenzene (1.22 g, 45%).

To an ice cooled solution of 2-(2-propynyl)azidobenzene (2.0 g, 12.72 mmol) in dry THF (50 mL) was added slowly lithium aluminum hydride (0.96 g, 25.44 mmol) at 0 °C and the reaction mixture was allowed to stir at the same temperature until the completion of the reaction (TLC). It was then quenched with ethanol and water at 0 °C and the solvent was removed under reduced pressure. The residue was extracted with ethyl acetate (3 × 40 mL), and washed with water (30 mL) and brine (30 mL) successively. The organic layer was dried over anhydrous Na₂SO₄ and concentrated under reduced pressure. The resulting crude product was purified through silica gel (100-200 mesh) column chromatography (ethyl acetate-petroleum ether) to afford 2-(2-propynyl)aniline 7a (1.25 g, 75%).

To a solution of compound 7a (1.0 g, 7.62 mmol) in dry DCM (30 mL) were added successively pyridine (0.92 mL, 11.43 mmol) and p-toluenesulfonyl chloride (1.74 g, 9.14 mmol) at 0 °C and the reaction mixture was then allowed to stir at room temperature for 2 h. After completion of the reaction (tlc), it was extracted with DCM (2 × 30 mL), washed with water (20 mL) and brine (20 mL), dried over anhydrous Na₂SO₄, and concentrated under reduced pressure. The resulting residue was purified through silica gel (100-200 mes) column chromatography (ethyl acetate-petroleum ether) to afford the desired product 7b (1.69 g, 78%).
4. Spectral data of starting substrates 7a-b:

2-(Prop-2-ynyl)aniline (7a): Light yellow solid (1.25 g, 75% yield); mp 40-42 °C; \(^1\)H NMR (CDCl\(_3\), 300 MHz) \(\delta_H\) 7.18 (d, \(J = 7.5\) Hz, 1H), 7.10 (td, \(J = 7.6, 1.2\) Hz, 1H), 6.79-6.69 (m, 2H), 3.83 (brs, 2H), 3.44 (d, \(J = 2.7\) Hz, 2H), 2.18 (t, \(J = 2.7\) Hz, 1H); \(^{13}\)C NMR (CDCl\(_3\), 75 MHz) \(\delta_C\) 144.4, 129.3, 128.2, 120.8, 118.9, 116.0, 80.8, 70.7, 21.6; HRMS (EI+) calcd. for C\(_9\)H\(_9\)N [M]\(^+\) 131.07350, found 131.07352.

2-(2-Propynyl)tosylanilide (7b):\(^3\) Colorless solid (1.69 g, 78% yield); mp 118-120 °C; \(^1\)H NMR (CDCl\(_3\), 300 MHz) \(\delta_H\) 7.61 (d, \(J = 8.4\) Hz, 2H), 7.31-7.17 (m, 6H), 6.83 (brs, 1H), 3.19 (d, \(J = 2.4\) Hz, 2H), 2.39 (s, 3H), 2.24 (t, \(J = 2.7\) Hz, 1H); \(^{13}\)C NMR (CDCl\(_3\), 75 MHz) \(\delta_C\) 143.9, 136.6, 134.3, 130.6, 129.65, 129.62, 128.1, 127.1, 126.9, 125.9, 80.4, 71.9, 21.6, 21.5; HRMS (EI+) calcd. for C\(_{16}\)H\(_{15}\)NO\(_2\)S [M]\(^+\) 285.08235, found 285.08261.
