Experimental Section

**General.** $^1$H NMR and $^{13}$C NMR spectra were measured with a JEOL EX–400 (400 MHz for $^1$H and 10 MHz for $^{13}$C) spectrometer. $^{29}$Si NMR spectra were measured with a JEOL JNM-A400 (80 MHz) spectrometer. Coupling constants ($J$ value) are reported in Hertz. The chemical shifts are expressed in ppm downfield from tetramethylsilane, using residual chloroform ($\delta = 7.24$ in $^1$H NMR, $\delta = 77.0$ in $^{13}$C NMR) or residual DMSO ($\delta = 2.49$ in $^1$H NMR, $\delta = 39.5$ in $^{13}$C NMR) as an internal standard. MASS spectra were obtained on a JEOL JMS–SX102A. Emission from the samples was monitored using a Perkin Elmer LS50B at 25 °C using 1 cm path length cell. MASS spectra were obtained on a JEOL JMS–SX102A. Synthesis was carried out according to Schemes S1 and S2.

**Encapsulation of nucleoside derivatives.** General procedure for the complexation of guanosine nucleosides by the POSS network polymers is described here. The stock solutions of the POSS-N network polymers (x10) and guanosine nucleosides (x10) were
mixed at room temperature, and then the 500 $\mu$L of the samples were prepared by adding the PBS buffer (pH 7.4) solution. The complexation with POSS-Ru network polymers was also prepared with the same procedure in PBS buffer solution containing potassium ferricyanide ($K_3[Fe(CN)_6]$).

**Fluorescence measurements of the complexes.** The fluorescence emissions of the naphthyridine ligand 5 (20 $\mu$M naphthyridine in the POSS-N network polymer and 10 $\mu$M the naphthyridine in POSS-Ru network polymer) in the presence and absence of the guanosine nucleosides with the excitation light at 424 nm were monitored using a Perkin Elmer LS50B at 25 °C using 1 cm path length cell. The excitation and the emission bandwidth were 1 nm. The quantum yields were determined as an absolute value with an integral sphere.

**Stern–Volmer plots.** The data were analyzed with the Stern–Volmer equation:

$$\frac{I_0}{I} = 1 + K_{sv} [Q]$$

The emission intensities were plotted according to a Stern–Volmer equation, reporting $I_0/I$ versus the concentrations of guanosine nucleosides $[Q]$, where $I_0$ is the intensity in the absence of quencher and $I$ is the intensity in the presence of a quencher.
concentration. $K_{SV}$ is the Stern–Volmer quenching constant. A plot of $I_0/I$ versus $[Q]$ yields an intercept of one and a slope equals to $K_{SV}$.

**Binding constants calculation.** According to the non-emissive complex formation between the 1,8-naphthyridine receptor and guanosine nucleosides, the binding constant ($K_A$) can be calculated with the number of the binding molecules ($n$) from the following equation:

$$\log \frac{I_0-I}{I} = \log K_A + n \log [Q]$$

Figure 2 in the main text represents the plots for evaluating the $K_A$ values of the 1,8-naphthyridine ligands to GDP and GTP.
