Supporting Information

An efficient synthetic route to 1,3-bis(arylethynyl)isobenzofuran by using alkoxybenzocyclobutenone as a reactive platform

Kenta Asahina, Suguru Matsuoka, Ryosuke Nakayama, and Toshiyuki Hamura*

Department of Chemistry, School of Science and Technology Kwansei Gakuin University, 2-1 Gakuen, Sanda, Hyogo 669-1337, Japan

General Experimental Procedures

All experiments dealing with air- and moisture-sensitive compounds were conducted under an atmosphere of dry argon. THF (anhydrous; Wako Pure Chemical Industries, Ltd.) was used as received.

For thin-layer chromatography (TLC) analysis, Merck pre-coated plates (silica gel 60 F_{254}, Art 5715, 0.25 mm) were used. For flash column chromatography, silica gel 60 N (spherical, neutral, 63–210 μm) from Kanto Chemical was used. Silica gel preparative TLC (PTLC) was performed on Merck silica gel 60 PF_{254} (Art 7749).

^1H NMR and ^13C NMR were measured on a JEOL JNM ECA-300 and a JEOL JNM ECA-400 spectrometer. Attenuated Total Reflectance Fourier Transformation Infrared (ATR-FTIR) spectra were recorded on a Perkin Elmer 1600 FTIR. High resolution mass spectra were obtained with a JEOL The AccuTOF LC-plus JMS-T100LP, Bruker solariX, and Bruker micrOTOF-Q. Melting point (mp) determinations were performed by using a Yanako MP-S3 instrument and are uncorrected.
General Procedure for Preparation of Alkynylbenzocyclobutenol

\[\text{Scheme 1.}\]

Synthesis of hydroxybenzocyclobutenone \textbf{iv}:
To a mixture of tosylate \textbf{i} (39.7 g, 0.106 mol) and ketene silyl acetal \textbf{ii} (35.1 g, 0.127 mmol) in Et$_2$O (366 mL) was added n-BuLi (1.55 M in hexane, 94.1 mL, 0.146 mol) at –78 °C. After gradually warmed up to room temperature for 72 h, the reaction was stopped by adding water. Extractive workup (EtOAc) followed by evaporation gave crude cycloadduct \textbf{iii}. To a solution of cycloadduct \textbf{iii} (46.9 g) in MeCN (300 mL) was added 46% aq. HF (20.2 mL, 0.532 mol) at 0 °C. After warmed up to room temperature, the reaction was further stirred for 6.5 h. The reaction was stopped by adding sat. aq. NaHCO$_3$ at 0 °C. The products were extracted with EtOAc (X3) and the combined organic extracts were washed with brine, dried (Na$_2$SO$_4$), and concentrated in vacuo. The residue was purified by flash column chromatography (hexane/EtOAc = 7/3) to give \textbf{iv} (10.8 g, 75.9%) as white solids.

\]

Synthesis of siloxybenzocyclobutenone \textbf{4}:
To a solution of hydroxyketone \textbf{iv} (412 mg, 3.07 mmol) in DMF (3.0 mL) was added TBDMSCl (689 mg, 4.65 mmol) and imidazole (417 mg, 6.13 mmol) at 0 °C. After warmed up to room temperature, the reaction was further stirred for 3 h. The reaction was stopped by adding sat. aq. NaHCO$_3$ at 0 °C. The products were extracted with Et$_2$O (X3) and the combined organic extracts were washed with brine, dried (Na$_2$SO$_4$), and concentrated in vacuo. The residue was purified by flash column chromatography (hexane/EtOAc = 19/1) to
give siloxyketone 4 (592 mg, 77.5%) as a colorless oil.

**Synthesis of benzocyclobutenol 5a:**
To a solution of phenylacetylene (574 mg, 5.64 mmol) in THF (13.5 mL) was added \(n\)-BuLi (1.6 M in hexane, 2.8 ml, 4.6 mmol) at 0 °C. After 30 min, the reaction was cooled to –78 °C, to which was added benzocyclobutenone 4 (1.00 g, 4.03 mmol) in THF (10 mL). After warmed up to –30 °C, the reaction was stopped by adding water. The products were extracted with EtOAc (X3) and the combined organic extracts were washed with brine, dried (Na\(_2\)SO\(_4\)), and concentrated in vacuo. The residue was purified by flash column chromatography (hexane/EtOAc = 19/1) to give the benzocyclobutenol 5a (1.34 g, 95.0%) as a colorless oil.

General Procedure for Oxidative Ring Cleavage of Alkynylbenzocyclobutenol into keto-aldehyde

![Scheme 2.]

**Synthesis of keto-aldehyde 7a (Method A):**
To a solution of alkynylbenzocyclobutenol 5a (75.4 mg, 0.215 mmol) in HFIP–H$_2$O (1.8–0.2 mL) was added PIDA (72.9 mg, 0.226 mmol) at room temperature, and the reaction mixture was stirred for further 10 min. The reaction was stopped by adding sat. aq. NaHCO$_3$. The products were extracted with EtOAc (X3), washed with sat. aq. NaHCO$_3$, brine, dried (Na$_2$SO$_4$), and concentrated in vacuo. The residue was purified by PTLC (hexane/EtOAc = 8/2) to give keto-aldehyde 7a (45.5 mg, 90.2%) as yellow solids.

**Synthesis of keto-aldehyde 7a (Method B):**
To a solution of alkynylbenzocyclobutenol 5a (195 mg, 0.558 mmol) in CH$_3$CN (10.5 mL) was added MnO$_2$ (970 mg, 11.2 mmol) at room temperature, and the reaction mixture was stirred for further 2 h. After removing MnO$_2$ by filtration, the filtrate was concentrated in vacuo. The residue was purified by flash column chromatography (hexane/EtOAc = 9/1) to give keto-aldehyde 7a (107 mg, 81.5%) as yellow solids.

Synthesis of dialkynylisobenzofuran 9e:
To a solution of keto-aldehyde 7a (21.0 mg, 0.090 mmol) in THF (1.5 mL) was added
[4-(dimethylamino)phenylethynyl]lithium (0.56 M in THF, 0.32 mL, 0.179 mmol), prepared
by treatment of 4-ethynyl-N,N-dimethylaniline (88.1 mg, 0.60 mmol) with n-BuLi (1.55 M in
hexane, 0.39 ml, 0.605 mmol) in THF (0.7 mL) at −78 °C. After gradually warmed up to
−40 °C for 3 h, acetic anhydride (1.0 mL) was added to the reaction mixture at 0 °C, and the
reaction was stirred at room temperature. After 3 h, the reaction was stopped by adding sat.
aq. NaHCO\(_3\). The products were extracted with EtOAc (X3), washed with brine, dried
(Na\(_2\)SO\(_4\)), and concentrated in vacuo. The residue was purified by flash column
chromatography (hexane/CH\(_2\)Cl\(_2\) = 95/5) to give dialkynylisobenzofuran 9e (13.9 mg, 42.9%)
as a red oil.

Synthesis of dialkynylisobenzofuran 11:
To a solution of 1,4-diethynylbenzene (22.3 mg, 0.177 mmol) in THF (2.0 mL) was added n-BuLi (1.63 M in hexane, 0.220 ml, 0.352 mmol) at 0 °C. After 10 min, the reaction was cooled to −78 °C, to which was added keto-aldehyde 7a (99.4 mg, 0.424 mmol) in THF (2.0 ml). After gradually warmed up to room temperature for 6 h, the reaction was stopped by adding water. The products were extracted with EtOAc (X3) and the combined organic extracts were washed with brine, dried (Na₂SO₄), and concentrated in vacuo. The residue was purified by flash column chromatography (hexane/EtOAc = 7/3 → 6/4) to give the bis-adduct (53.8 mg, 50.8%) as a yellow oil. To a solution of bis-adduct (53.8 mg) in THF (2.0 mL) was added 4 M HCl (0.5 mL) at 0 °C. After warmed up to room temperature, the reaction was further stirred for 3 h. The reaction was stopped by adding sat. aq. NaHCO₃ at 0 °C. The products were extracted with CHCl₃ (X3) and the combined organic extracts were washed brine, dried (Na₂SO₄), and concentrated in vacuo. The residue was triturated in hexane and filtrated to give the essentially pure product 11 (49.6 mg, 98.8%) as orange solids.
