Copies of <sup>1</sup> H- and <sup>13</sup> C-NMR spectra and X-Ray diffraction data	3- 34
Summary of experiments aimed to optimize the synthesis of 5	35

**General:** Solvents were dried according to published methods and distilled before use except THF, CH<sub>2</sub>Cl<sub>2</sub>, CH<sub>3</sub>CN, MeOH, Et<sub>2</sub>O and DMF which were dried using a Puresolv™ solvent purification system. All other reagents were commercial compounds of the highest purity available. Unless otherwise indicated all reactions were carried out under argon atmosphere, and those not involving aqueous reagents were carried out in oven-dried glassware. Analytical thin layer chromatography (TLC) was performed on aluminium plates with Merck Kieselgel 60F254 and visualised by UV irradiation (254 nm) or by staining with an ethanolic solution of phosphomolybdic acid. Flash column chromatography was carried out using Merck Kieselgel 60 (230-400 mesh) or SiliaFlash® P60 (230-400mesh) under pressure. Electron impact (EI) mass spectra were obtained on a Hewlett-Packard HP59970 instrument operating at 70 eV. Alternatively an APEX III FT-ICR MS (Bruker Daltonics, Billerica, MA), equipped with a 7T actively shielded magnet was used and ions were generated using an Apollo API electrospray ionization (ESI) source, with a voltage between 1800 and 2200 V (to optimize ionisation efficiency) applied to the needle, and a counter voltage of 450 V applied to the capillary. For ESI spectra samples were prepared by adding a spray solution of 70:29.9:0.1 (v/v/v) CH<sub>3</sub>OH/water/formic acid to a solution of the sample at a v/v ratio of 1 to 5% to give the best signal-to-noise ratio. High Resolution mass spectra were taken on a VG Autospec instrument. <sup>1</sup>H NMR spectra were recorded in CDCl<sub>3</sub> and DMSO-d<sub>6</sub> at ambient temperature on a Bruker AMX-400 spectrometer at 400 MHz with residual protic solvent as the internal reference [CDCl<sub>3</sub>, δ<sub>H</sub> = 7.26 ppm; DMSO-d<sub>6</sub>, δ<sub>H</sub> = 2.50 ppm]; chemical shifts (δ) are given in parts per million (ppm), and coupling constants (*J*) are given in Hertz (Hz). The proton spectra are reported as follows: δ (multiplicity, coupling constant *J*, number of protons, assignment). <sup>13</sup>C NMR spectra were recorded in CDCl<sub>3</sub> or DMSO-d<sub>6</sub> at ambient temperature on the same spectrometer at 100 MHz, with the central peak of CDCl<sub>3</sub> (δ<sub>C</sub> = 77.0 ppm) and DMSO-d<sub>6</sub> (δ<sub>C</sub> = 39.52 ppm) as the internal reference. DEPT135 are used to aid in the assignment of signals in the <sup>13</sup>C NMR spectra.

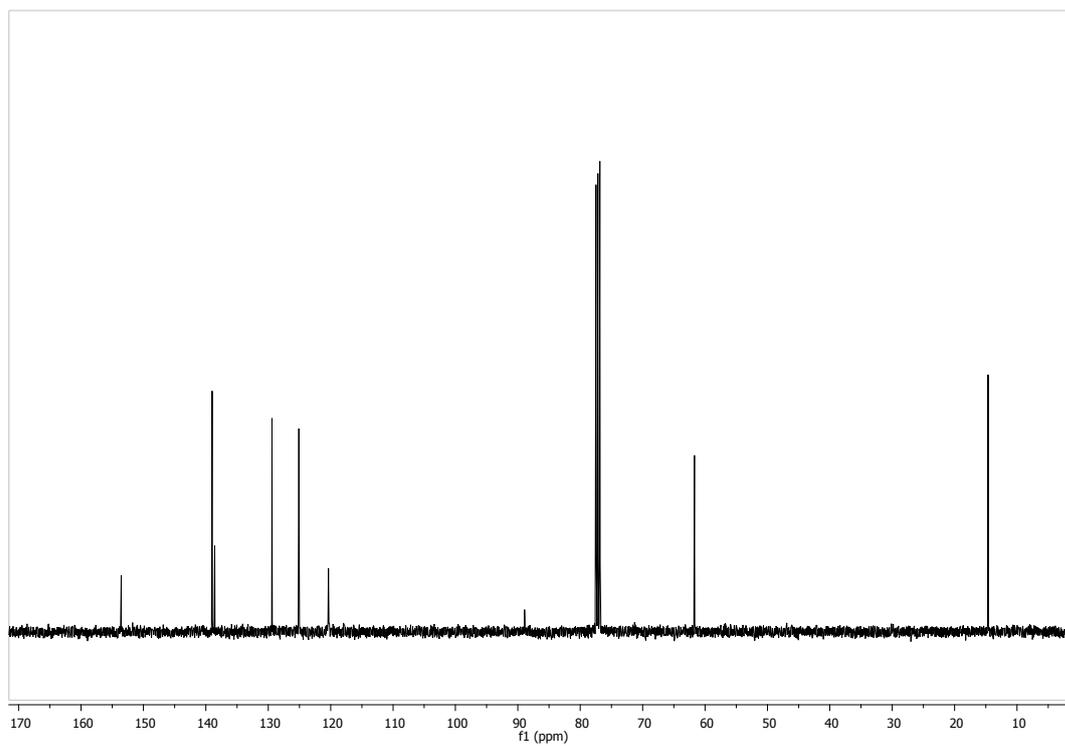

## Spectroscopic data

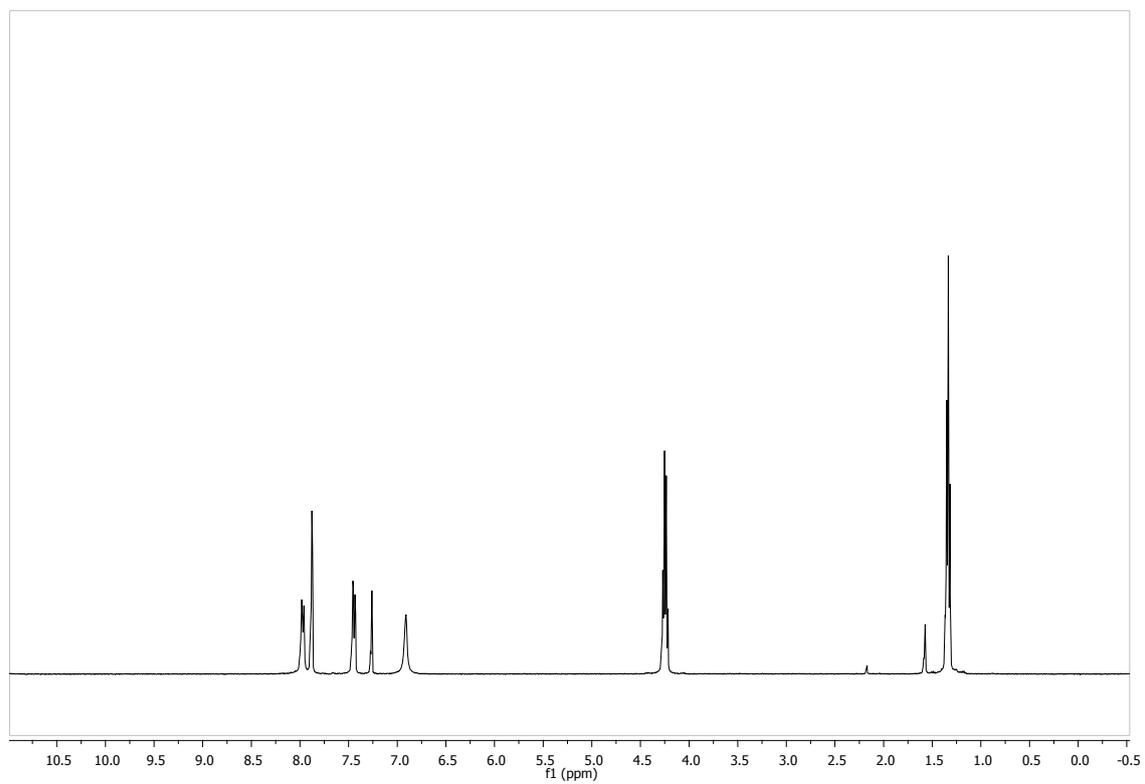

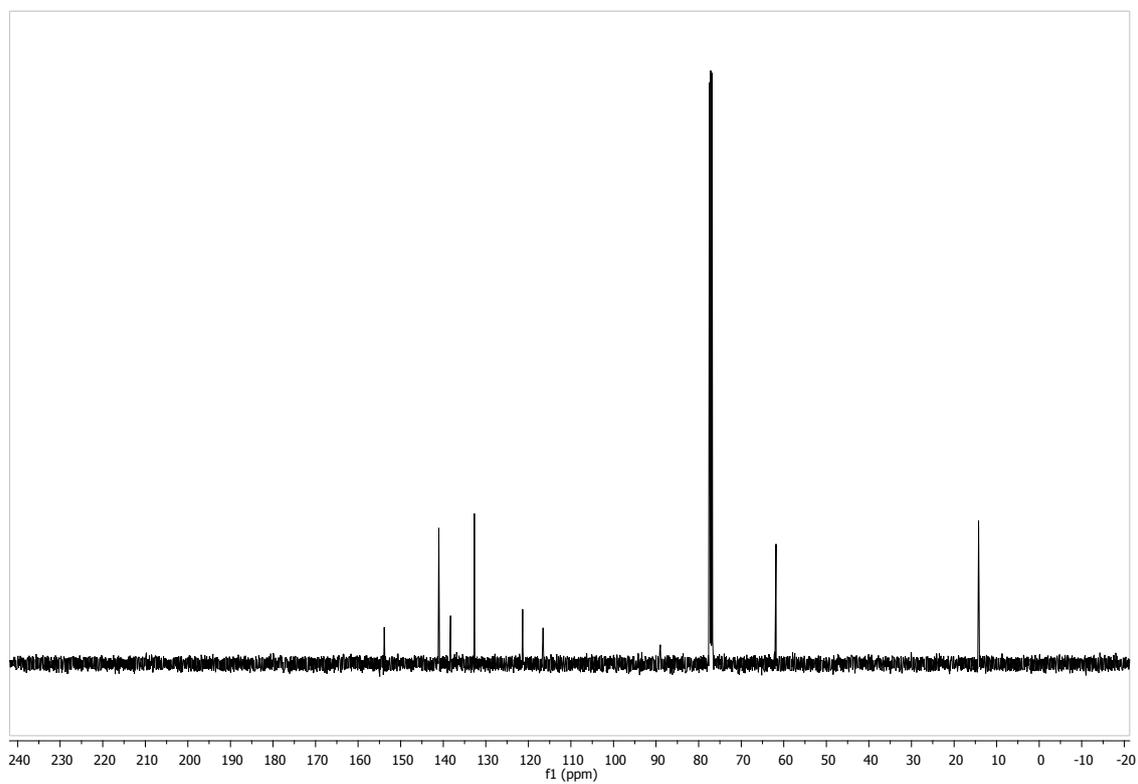

Ethyl (2-Iodophenyl)-carbamate **6b**.

**TABLE 1. CRYSTAL DATA AND STRUCTURE REFINEMENT FOR 4ab**

Empirical formula  $C_{20}H_{16}N_2O_3$

Formula weight 332.35

Temperature 293 K

Wavelength 0.71073 Å

Crystal system Monoclinic

Space group P2(1)/c

Unit cell dimensions  $a = 9.2474(15)$  Å  $\alpha = 90^\circ$ .

$b = 21.492(3)$  Å  $\beta = 93.323(3)^\circ$ .

$c = 8.1455(13)$  Å  $\gamma = 90^\circ$ .

Volume 1616.2(4) Å<sup>3</sup>

Z 4

Density (calculated) 1.366 Mg/m<sup>3</sup>

Absorption coefficient 0.093 mm<sup>-1</sup>

F(000) 696

Crystal size 0.49 x 0.48 x 0.23 mm<sup>3</sup>

Theta range for data collection 1.90 to 25.07°.

Index ranges  $-11 \leq h \leq 10$ ,  $-25 \leq k \leq 25$ ,  $-9 \leq l \leq 9$

Reflections collected 12062

Independent reflections 2852 [R(int) = 0.0223]

Completeness to theta = 25.00° 99.9 %

Absorption correction Semi-empirical from equivalents

Max. and min. transmission 0.7452 and 0.6754

Refinement method Full-matrix least-squares on F<sup>2</sup>

Data / restraints / parameters 2852 / 0 / 231

Goodness-of-fit on F<sup>2</sup> 1.033

Final R indices [ $I > 2\sigma(I)$ ] R1 = 0.0339, wR2 = 0.0859

R indices (all data) R1 = 0.0444, wR2 = 0.0959

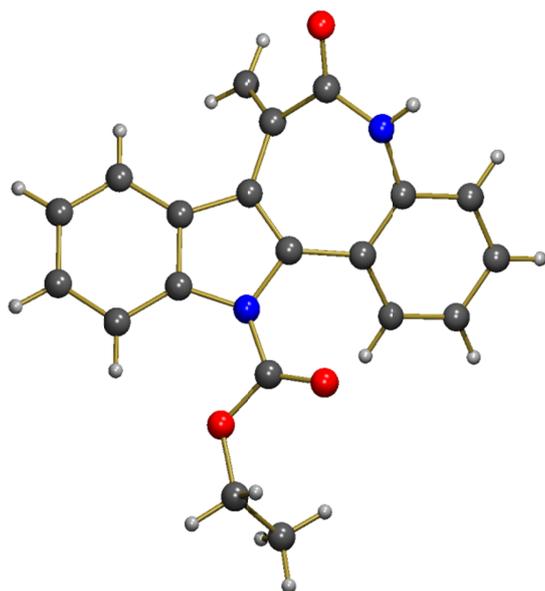

Largest diff. peak and hole 0.171 and -0.173 e.Å<sup>-3</sup>
