Experimental Section

Materials

K$_2$CO$_3$, KF, toluene, magnesium turnings, CuI, TBAB, Pd(PPh$_3$)$_4$, MgSO$_4$, BF$_3$·Et$_2$O (> 95%), 1,2-dichlorobenzene, 1-bromo-4-(octyloxy)benzene (> 98%), carbazole (> 95%), acetone, 2,2′-bipyridine, 1,10-phenanthroline were purchased from Aldrich or J&K Chemicals without further purification. 2-bromo-fluoren-9-one (> 99%), 2,7-dibromo-fluoren-9-one (> 99%), thiophen-2-yl boronic acid (> 98%) were obtained from Nanjing Fountain Global Displays Ltd. Co. All experiments were carried out under a nitrogen atmosphere in a dry box or by standard Schlenk techniques. THF was dried over sodium benzophenone ketyl anion radical and distilled under a dry nitrogen atmosphere immediately prior to use. CH$_2$Cl$_2$ was distilled at the present of P$_2$O$_5$.

Characterization

$^1$H (400 MHz) and $^{13}$C NMR (100 MHz) spectra were recorded on a Bruker 400 MHz spectrometer. Chloroform-$d$ was used as a solvent. Chemical shifts were reported as δ values (ppm) relative to internal tetramethylsilane (TMS) in CDCl$_3$ unless otherwise noted. Gas chromatography-mass spectrum ((GC/MS) were performed with a Shimadzu GCMS 2010, helium used as a carrier gas. The sample (1 mg) was dissolved in dichloromethane (1 mL) and a 2 μL aliquot of the solution was injected. The peaks for products were identified by comparison with pure substance peaks. Molecular weights of the samples were measured by Gel permeation chromatography (GPC) on a Shimadzu LC-20A HPLC system equipped with 7911GP-502 and GP NXC columns. The calibration curves for GPC analysis were obtained using polystyrene standards with a low polydispersity. The sample (10 mg) was dissolved in THF (2 mL) and the solution was filtered through a membrane filter with a 0.45 μm
pore size. Fourier transfer infrared (FT-IR) spectra were measured by neat on a KBr plate. Absorption spectra were measured with a Shimadzu UV-3600 spectrophotometer at 25°C, and photoluminescence spectra were recorded on a Shimadzu RF-5301(PC)S luminescence spectrometer. The sample was measured in CH₂Cl₂ (1.0×10⁻⁵ mol/L) and in film states. Thermogravimetric analysis (TGA) was undertaken with a Shimadzu thermogravimetry and differential thermal analysis DTG-60H at a heating rate of 10 °C/min under N₂. The electrochemical cyclic voltammetry (CV) was conducted on CHI 600C Electrochemical Workstation, in a 0.1 mol/L acetonitrile solution of tetrabutylammonium hexafluorophosphate (n-Bu₄N⁺PF₆⁻) at a potential scan rate of 100 mV/s with an Ag/Ag⁺ reference electrode, a platinum wire counter electrode, and a platinum sheet working electrode, polymer film was formed by drop-casting 1.0 μL of polymer solutions in CH₂Cl₂ (refined, 1 mg/mL) onto the working electrode, and then dried in the air.
