Materials

All chemicals were purchased either from Acros Organics, Alfa Aesar, Cambridge Isotope Labs, or Sigma-Aldrich and used without further purification unless otherwise noted. The dichloromethane used in polymerization was distilled twice from calcium hydride and degassed by the freeze-pump-thaw method. L-lactide was recrystallized three times from toluene. Compound 1 and exo-bicyclo[2.2.1]hept-5-ene-2-carboxylic acid 6 were synthesized according to literature reports.

Characterization methods

$^1$H- and $^{13}$C-NMR spectroscopy measurements were performed on a Bruker Avance-600 ($^1$H: 600 MHz; $^{13}$C: 150 MHz), Avance-500 ($^1$H: 500 MHz; $^{13}$C: 125 MHz) and Avance-400 ($^1$H: 400 MHz; $^{13}$C: 100 MHz) NMR Spectrometer. Chemical shifts are reported in ppm and referenced to the corresponding residual protons in deuterated solvents. $^{31}$P NMR spectroscopy measurements were performed on a Bruker Avance-600 ($^{31}$P: 242 MHz) and Avance-500 ($^{31}$P: 203 MHz) spectrometer. Size Exclusion Chromatography (SEC) analyses were carried out using a Shimadzu pump and Shimadzu UV and RI detectors, with tetrahydrofuran (THF) as the eluent, and a set of Polymer Standards columns (AM GPC gel, 10 µm, precolumn, 300 Å and linear mixed bed). Commercially available PS standards were used. The flow rate used for all measurements was 1 mL/min. $M_n^{\text{app}}$ and $\text{PDI}^{\text{app}}$ represent the apparent
number-average molecular weight, and apparent polydispersity index, respectively. The ESI mass spectra were obtained using an Agilent 1100 series Capillary LCMSD Trap SCT Spectrometer using methanol solutions of the products. Elemental Analysis (EA) (CHN) experiments were performed by Atlantic Microlab, Inc. (Norcross, GA, USA).

Polymer synthesis

General homopolymerization procedure of norbornene (8)
The desired amount of norbornene monomer 7 was dissolved in anhydrous, degassed CH$_2$Cl$_2$. A solution of bifunctional initiator 5 in CH$_2$Cl$_2$ was added. The monomer concentration after addition of bifunctional initiator 5 was 0.1 M. The solution was stirred at 25 °C for 30 min. Upon complete polymerization, ethyl vinyl ether was added to quench the polymerization. The residue was purified by repeated precipitation into MeOH.

General homopolymerization procedure of l-lactide (9)
In a glove box, the desired amount of l-lactide and bifunctional initiator 5 were dissolved in anhydrous, degassed CH$_2$Cl$_2$. 1,5,7-Triazabicyclo[4.4.0]dec-5-ene (TBD) was added as a solution in CH$_2$Cl$_2$. The monomer concentration after addition of TBD was 1 M. The reaction was allowed to stir at 25 °C for 12 hours. After the reaction was complete, excess benzoic acid was added to quench the polymerization. The polymer was isolated and purified by repeated precipitations into MeOH.
General copolymerization of L-lactide and norbornene (10)

In a glove box, norbornene monomer 7 was dissolved in anhydrous, degassed CH2Cl2 in a screw-top vial. A solution of bifunctional initiator 5 in CH2Cl2 was added and the reaction was allowed to stir at room temperature for 1 hour. A solution of L-lactide monomer in CH2Cl2 and a solution of TBD in CH2Cl2 were added to the PNB solution. The monomer (L-lactide) concentration after addition of all components was 0.1 M. The reaction was allowed to stir at room temperature for 12 hours. Ethyl vinyl ether and benzoic acid were added to quench the polymerization. The residue was purified by repeated precipitation into MeOH.
