General Information:

Chemical reagents were used as received. 2-Bromo-NDA, 2,6-dibromo-NDA, 1,1-dicyanoethene-2,2-dithiolate and 5,5’-bis(trimethylstannyl)-2,2’-bithiophene were synthesized according to previously published procedures. $^1$H NMR spectra and $^{13}$C NMR spectra were measured in CDCl$_3$ on Varian Mercury (300 MHz or 400 MHz) instruments, using tetramethylsilane as an internal standard. Mass spectra (MALDI-TOF) were recorded on a Voyager-DE STR Mass Spectrometer or a Bruker Biflex III MALDI-TOF Spectrometer. Elemental analyses were performed on an Elemental Vario EL III elemental analyzer. Electronic absorption spectra were measured on a U-3900 UV-vis spectrophotometer. Fluorescence spectra were measured on a HITACHI F-2700 fluorescence spectrophotometer. TGA measurements were carried out on a TA Q500 instruments under a dry nitrogen flow at a heating rate of 10 °C/min, heating from room temperature to 500 °C. DSC analyses were performed on a Perkin Elmer Pyris I instruments under nitrogen atmosphere at a heating (cooling) scan rate of 10 °C/min, heating from rt−300 °C. Cyclic voltammetric measurements were carried out in a conventional three-electrode cell using a platinum button working electrode, a platinum wire counter electrode, and a saturated calomel electrode (SCE) reference electrode on a computer-controlled CHI610D instruments.
A mixture of 2-bromo-NDA (1 g, 2.9 mmol), n-octylamine (1.4 mL, 8.7 mmol), and acetic acid (30 mL) was stirred at 90 °C for 3 h.
