General Information:

$^1$H NMR and $^{13}$C NMR (Avance 300, Innova 400 MHz and Brucker Gemini 200 MHz) spectra were recorded in CDCl$_3$. Chemical shifts ($\delta$) were reported in ppm, and spin-spin coupling constants ($J$) were in Hz. Melting points were determined on a Fischer-Johns melting point apparatus. IR and MS were recorded on a Thermo Nicolet Nexus 670 FT-IR spectrometer and Finnegan MAT 1020 mass spectrometer operating at 70 eV.

Representative experimental procedure for oxidative cyanation of tertiary amines:
The reaction was carried in a 25 mL round bottom flask equipped with magnetic stir bar charged with $N,N$-dimethylaniline (1 mmol), ethyl cyanoformate (2 mmol), 5–6 M TBHP solution in decane (2.5 mmol), methanol (3 mL) and Ru/C (20 mg) catalyst. The resulting reaction mixture was stirred at 60 °C for 6h. The reaction progress was monitored by TLC. After the reaction, Ru/C was separated by centrifugation and the solvent was evaporated and the crude product was purified by column chromatography. The identity and purity of the product was confirmed by $^1$H NMR, $^{13}$C NMR and ESI-MS.

Recycling of the catalyst:

After the reaction was complete, the reaction mixture was allowed to cool, and Ru/C was removed by centrifugation. After each cycle, the catalyst was recovered by simple centrifugation, washing with ethyl acetate followed by acetone and then drying in vacuo. The recovered Ru/C was used directly in the next cycle. The native and used Ru/C were analyzed by TEM analysis. It was observed from the TEM studies that the used Ru/C was intact in size and shape even after four cycles compared to the native catalyst.
