Figure S1 Fourier Transform Infrared spectra of bare cysteamine Hydrochloride (Cys-HCl). Feeble bands at 888 cm\(^{-1}\) and 939 cm\(^{-1}\) refer to alkane CH\(_2\) bending and amine C-H bending. Prominent bands at 1635 cm\(^{-1}\) and 2133 cm\(^{-1}\) depict amide NH bend and mercaptan –SH stretch respectively arising out of the structure of Cysteamine. Wide band at 3320 cm\(^{-1}\) is because of aqueous counterpart due to –OH stretchings.
