General Experimental Procedures. All reactions were carried out in oven or flame-dried glassware with magnetic stirring under nitrogen atmosphere using dry, freshly distilled solvents, unless otherwise noted. Reactions were monitored by thin layer chromatography (TLC) carried out on 0.25 mm silica gel plates with UV light, I2, 7% ethanolic phosphomolybdic acid-heat and 2.5% ethanolic anisaldehyde (with 1% AcOH and 3.3% conc. H2SO4)-heat as developing agents. Silica gel finer than 200 mesh was used for flash column chromatography. Yields refer to chromatographically and spectroscopically homogeneous materials unless otherwise stated. Optical rotations were measured using Autopol III manufactured by Rudolph using sodium (589, D line) lamp and are reported as follows: [α]D 25 (c = g/100 ml, solvent). IR spectra were recorded as neat liquids or KBr pellets. Mass spectra were obtained under electron impact ionisation (EI), liquid secondary ion mass spectrometric (LSIMS) technique, electron spray ionisation (ESI) and MALDI techniques. NMR spectra were recorded on 500, 400 and 300 MHz spectrometers at 30 °C with 2-10 mM solutions in appropriate solvents using TMS as internal standard or the solvent signals as secondary standards and the chemical shifts are shown in δ scales. Multiplicities of NMR signals are designated as s (singlet), d (doublet), t (triplet), q (quartet), br (broad), m (multiplet, for unresolved lines), etc. 13C NMR spectra were recorded on 125, 100 and 75 MHz spectrometers with complete proton decoupling.

Synthesis of 17.

To a solution of diol 16 (10 gm, 61.73 mmol) in CH2Cl2 (200 mL) were added Et3N (17.2 mL, 123.46 mmol), Bu2SnO (3.1 gm, 12.346 mmol) and TsCl (14.12 gm, 74.07 mmol) sequentially at 0 °C. After 15 min, temperature was raised to room temperature and stirred for another 1 h. Then the reaction was diluted with EtOAc and filtered through a pad of Celite. The filtrate was
concentrated under vacuo. Purification by column chromatography (SiO₂, with EtOAc-hexane, 4:6) gave tosylate (17.2 gm, 93%) as a yellow liquid. \( R_f = 0.4 \) (silica, EtOAc:hexane, 1:1).

The tosylate (17.2 gm, 57.41 mmol) was dissolved in CH₂Cl₂ (120 mL) and cooled to 0 °C. Et₃N (16.0 mL, 114.82 mmol) and triisopropylsilyltriflate (17.1 mL, 63.151 mmol) were added sequentially and stirring was continued for another 4 h at the same temperature. Then the reaction was quenched with satd. NH₄Cl (50 mL) and extracted with EtOAc (800 mL). EtOAc layer was washed sequentially with H₂O (2x100 mL), brine (100 mL) and dried over anhydrous Na₂SO₄. The organic layer was concentrated in vacuo to provide crude silyl ether which was used for next reaction without further purification. \( R_f = 0.6 \) (silica, EtOAc:hexane, 1:9).

The silyl ether was dissolved in DMSO (80 mL) and TsNH₂ (19.63 gm, 114.82 mmol) and KOH (3.67 gm, 172.23 mmol) were added to it. The resulting mixture was heated to 80 °C and stirring was continued for 10 h at that temperature. Then the temperature of the reaction mixture was brought down to room temperature and water was added to it. The reaction mixture was extracted with diethyl ether (500 mL) and washed sequentially with water (3x100 mL) and brine (100 mL) and dried over anhydrous Na₂SO₄. The organic layer was concentrated in vacuo. Purification by column chromatography (SiO₂, with EtOAc-hexane, 2:8) gave the protected amino-alcohol 17 (21.2 gm, 87% from tosylate) as a pale yellow liquid. \( R_f = 0.4 \) (silica, EtOAc:hexane, 3:7); \([\alpha]_{D}^{25} +1.92 \) (c 1.93, CHCl₃); IR (neat): ν 3401, 3019, 1216, 1161, 757, 669 cm⁻¹; \(^1\)H NMR (CDCl₃, 300 MHz): δ 7.73 (d, \( J = 8.09 \) Hz, 2 H), 7.31 (d, \( J = 8.09 \) Hz, 2 H), 4.93 (dd, \( J = 7.30, 4.54 \) Hz, 1 H), 4.20 (dd, \( J = 12.75, 6.68 \) Hz, 1 H), 4.03-3.92 (m, 2 H), 3.75-3.67 (m, 2 H), 3.09-2.93 (m, 2 H), 2.43 (s, 3 H), 1.37 (s, 3 H), 1.32 (s, 3 H), 1.01 (s, 21 H) ppm; \(^{13}\)C NMR (CDCl₃, 50 MHz): δ 143.5, 136.4, 129.7, 127.1, 109.5, 70.9, 65.0, 45.2, 26.1, 24.8, 21.5, 17.9, 12.3 ppm; MS (ESI) m/z (%): 414 (100) [M+H–C₃H₆O]+, 494 (10) [M+Na]+.

To a solution of naphthalene (840 mg, 6.57 mmol) in dry THF (8 mL), sodium (151 mg, 6.57 mmol) was added at RT. The reaction mixture was stirred at room temperature for 1 h. A deep green colour appeared. Then the stirring was stopped and the solution was allowed to stand for 30 min. Homoallyl alcohol 13a (430 mg, 0.657 mmol) was dissolved in THF (10 mL) and cooled to -78 °C and stirred for 10 min at that temperature. Then the Na-napthalenide solution that was prepared initially was cannulated into it. After 15 min, the reaction was quenched with H₂O (5 mL) and extracted with EtOAc (50 mL). EtOAc layer was washed sequentially with H₂O (2x15
