I. General Information

All experiments were carried out using common flask in air. All substrates were purchased from commercial suppliers and used as received directly unless otherwise noted. All solvents and other commercially available reagents were purchased from Acros or TCI companies and used directly. Reactions were monitored by thin layer chromatography (TLC) (Qingdao Haiyang Chemical Co. Ltd. Silica gel 60 F254). Products were detected using a UV/Vis lamp (254 nm). Column chromatography was performed on Qingdao Haiyang Chemical Co. Ltd. Gel 60 (200–300 mesh). The $^1$H and $^{13}$C NMR spectras were obtained on a Bruker 400 MHz NMR Fourier transform spectrometer. $^1$H NMR data was reported as: chemical shift (δ ppm), multiplicity, coupling constant (Hz), and integration. $^{13}$C NMR data was reported in terms of chemical shift (δ ppm) multiplicity, and coupling constant (Hz). Hertz (Hz). The spectra are referenced against the internal solvent (CDCl$_3$, δ 1H= 7.26 ppm, $^{13}$C= 77.0 ppm; DMSO-d6, δ 1H= 2.50 ppm, $^{13}$C= 40.0 ppm). Data is reported as follows: s= singlet, d= doublet, t= triplet, q=quartet and m= multiplet. ESI-MS spectra were recorded on a Bruker Esquire 3000. High resolution mass spectra (HR MS) were obtained on a Waters Micromass Q-Tof MicroTM instrument using the ESI technique.
II. Experimental Section

(a) General Procedure:

![Chemical Reaction]

An 50 mL vial was charged with magnetic stir bar, cinnamic acid (1) or phenylpropionic acid (a') (1.0 mmol), aliphatic acid (2, 1.5 mmol), copper powder (0.05 mmol), AgNO₃ (0.2 mmol) and K₂S₂O₈ (1.0 mmol) were added in turn, followed by CH₃CN/H₂O (3 mL/3 mL). After stirring at 90°C for 12 h (or at 110°C for 12 h), the reaction mixture was concentrated in vacuo and extracted with EtOAc (3 × 10 mL). The combined organic phase was washed by saturated NaHCO₃ solution and dried by anhydrous Na₂SO₄ and then evaporated under reduced pressure. The isolated yield was obtained by flash chromatography column on silica gel (gradient eluent of Ethyl acetate in Petroleum: 0 ~ 2%, v/v).
(b) Under the optimized conditions, the following substrates were not effective in this transformation.

In a word, primary acids failed to proceed under current conditions. The reactions of secondary acids containing ether, halide or ketone groups on adjacent position also do not proceed or produce low yields. Future studies will be aimed at overcoming these limitations. According to our test results, for 1 and 2, in their reactions, about 40% benzaldehyde was isolated. They maybe proceed via the following routes:

We did the controlled experiment:

For (E)-4-Methoxycinnamic acid, we obtained an interesting result and we do not know the mechanism of this reaction until now.
