1. Crystallographic description S1-S2
2. Spectral data S3-S12
3. Spectra (1H NMR, 13C NMR and HRMS) of compounds S13-S34

Experimental:

General information:

All the reagents were commercial grade and purified according to the established procedures. Organic extracts were dried over anhydrous sodium sulphate. Solvents were removed in a rotary evaporator under reduced pressure. Silica gel (60–120 mesh size) was used for the column chromatography. Reactions were monitored by TLC on silica gel 60 F254 (0.25 mm). NMR spectra were recorded in CDCl3 with tetramethylsilane as the internal standard for 1H NMR (400 MHz) CDCl3 solvent as the internal standard for 13C NMR (100 MHz). Elemental analysis was performed with a Perkin Elmer 2400 elemental analyzer. IR spectra were recorded in KBr or neat on a Nicolet Impact 410 spectrophotometer. Commercially available CuO nano (<50 nm) were purchased from Sigma-Aldrich.
Crystallographic Analysis: Crystal data were collected with Bruker Smart Apex-II CCD diffractometer using graphite by using graphite-monochromated Mo-\(K_{\alpha}\) radiation (\(\lambda = 0.71073\) Å) at 298 K. Cell parameters were retrieved using SMART\(^1\) USA, 1995 software and refined with SAINT\(^1\) for all observed reflections. Data reduction was performed with the SAINT software and corrected for Lorentzian and polarization effects. Absorption corrections were applied with the SADABS program\(^2\). The structures were solved by direct methods implemented in the SHELX-97\(^3\) program and refined by full-matrix least-squares methods on \(F^2\). All non-hydrogen atom positions were located in difference Fourier maps and refined anisotropically. The hydrogen atoms were placed in their geometrically generated positions. The crystals were isolated in rectangular shape from ethyl acetate and hexane mixture at room temperature.
