General information

Triethylamine (Et₃N), tetrahydrofuran (THF) and toluene were dried over potassium hydroxide and all of them were degassed under N₂ for 30 minutes before use. Deuterated solvents were purchased from Cambridge Isotope Laboratory. All other reagents were purchased and used without further purification.

NMR spectra were recorded on a Bruker 400 MHz Spectrometer (¹H: 400 MHz; ¹³C: 100 MHz; ³¹P: 161.9 MHz) at 298 K. The ¹H and ¹³C NMR chemical shifts were reported relative to residual solvent signals, and ³¹P NMR resonances to an internal unlocked sample of 85% H₃PO₄ (δ 0.0). Coupling constants (J) were denoted in Hz and chemical shifts (δ) in ppm. Multiplicities are denoted as follows: s = singlet, d = doublet, t = triplet, m = multiplet. UV-Vis spectra were recorded on a Cary 50 Bio UV-vis Spectrophotometer. Emission spectra were measured on a Cary eclipse luminescence spectrometer. Samples for absorption and emission measurements were contained in 1 cm quartz cuvettes.
