**General information.**

All chemicals were obtained from commercial suppliers and used without further purification except for dichloromethane which were distilled from P₂O₅. Column chromatography was carried out over silica gel (BDH 200–300 mesh) and TLC was performed using silica gel GF254 plates. ¹H NMR and ¹³C NMR spectra were recorded using a Bruker Avance (III) 500MHz spectrometer (operating at 500 and 125 MHz, respectively) in DMSO. High-resolution mass spectra were recorded on HPLC-Q-Tof MS (Micro) spectrometer. Melting points were measured with a shanghai WRS-1B digital melting point apparatus and are uncorrected. The substrates 2 and 3 were prepared according to the literature.⁹¹

**Synthesis of compound 1.**

Diaminomaleonitrile (221.2 mg, 2.0 mmol) and compound 3 (764 mg, 2 mmol) in 70 mL of absolute ethanol containing two drops of acetate acid as a catalyst were stirred for 12 hours at room temperature. The progress of the reaction was monitored by TLC (PE:EA = 3:1, v:v). When the raw material 3 disappeared, the reaction was terminated. The solvent was removed under reduced pressure, and the resulting residue was recrystallized from ethanol, and further purified by chromatography on silica using PE/EA (20:1, v:v) as eluent to give compound 1 (557.2 mg) in 56% yield, blank solid, m.p. = 228-230 °C. ¹H NMR (500MHz, DMSO-d₆, ppm): δ = 8.21 (s, 1H), 7.30–7.28 (d, J = 5.0 Hz, 2H), 7.13–7.12 (d, J = 15.0 Hz, 2H), 6.33 (s, 1H), 3.82 (s, 3H), 3.29 (s, 3H), 2.71 (s, 3H), 1.62 (s, 3H), 1.42 (s, 3H). ¹³C NMR (125MHz, DMSO-d₆, ppm): δ = 160.80, 159.68, 155.79, 150.53, 146.33, 143.66, 141.38, 133.60, 130.97, 129.95, 126.27, 125.59, 125.12, 124.00, 115.48, 115.31, 114.27, 106.63, 55.96, 15.21, 14.52, 13.12. HRMS (ESI): m/z Calca for C₂₅H₂₃BF₂N₆O: 472.1994 found: 472.1998.

**General Procedure for UV-Vis and Fluorescence Studies.**

For absorption and emission spectra, the metal salts concentration (1 x 10⁻² mol/L) were prepared by buffer solution pH = 6.8 and the compound 1 (1 x 10⁻⁵ mol/L) were prepared in solvent (H₂O:DMF = 3:7, v:v) as the mother liquor. Accurate draw 3 ml mother liquor, to which add 3 μL ions measuring their fluorescence intensity, selected response ion. Test the pH effect, interference ions on fluorescence probe(fig s8 and fig s9 ,The anion s interference concentration is 1 x 10⁻⁴ mol/L and the concentration of cations interference is 1 x 10⁻⁵ mol/L). Both fluorescence titration and UV spectra titration test probe. All the tests only test one time and they are as follows S1 to S15.

**Cell Culture Methods and Staining Procedure.**

The compound 1 working solution for cell staining was prepared from a 5 mM aqueous stock solution (containing 10% DMF) of compound 1 by diluting with 1 × PBS to a final concentration of 10 μM. Hela cells were maintained following protocols provided by the American type Tissue Culture Collection. Cells were seeded at a density of 1 x 10⁶ cells mL⁻¹ for confocal imaging in RPMI 1640 Medium supplemented with 10% fetal bovine serum (FBS), NaHCO₃ (2g/L), and 1% antibiotics (penicillin/streptomycin, 100 U/ml). Cultures were maintained at 37 °C under a humidified atmosphere containing 5% CO₂. Confocal fluorescence imaging studies were performed on a LSM 710 confocal laser-scanning microscope (Carl Zeiss Co. Ltd.). Prior to imaging, the medium was removed. Cell imaging was carried out after washing cells with PBS for three times.
Fig. S1 Changes in the fluorescence spectra of probe 1 (1 μM) upon addition of various anions (1 equiv.) (K₂Cr₂O₇, Na₂C₂O₄, Mg(ClO₄)₂, Na₂SO₃, NaClO, NaF, NaBr, NaHSO₄, AgNO₃, NaCl, NaHCO₃, Na₂CO₃, Na₂S, NaNO₂, NaI, Na₂SO₄, K₃PO₄, NaOAc, 1 μM) in PBS/DMF (3:7, v:v, pH = 6.8). Every drop of ion interval is 30s. λₑₓ = 470 nm.

Fig. S2 Changes in the fluorescence spectra of probe 1 (1 μM) upon addition of various cations and H₂O₂ (K₂Cr₂O₇, LiCl, NaCl, KCl, MgSO₄, CaCl₂, Ba(NO₃)₂, Al(NO₃)₃, Pb(NO₃)₂, KMnO₄, FeCl₃, Co(NO₃)₂, Ni(NO₃)₂, CuCl₂, Cr₂(SO₄)₃, AgNO₃, Zn(OAc)₂, CdCl₂, HgCl₂, (NH₄)₂Ce(NO₃)₆, and H₂O₂, 1 μM) in PBS/DMF (3:7, v:v, pH = 6.8). Every drop of ion interval is 30s. λₑₓ = 470 nm.
**Fig. S3** The fluorescence spectra of probe 1 (1 μM) in different solvents, wait for 30s each test, $\lambda_{\text{ex}} = 470$ nm.

**Fig. S4** The fluorescence spectra of probe 1 (1 μM) in the presence of Cr(VI) ($\text{Cr}_2\text{O}_7^{2-}$, 1 μM) in different solvents, wait for 30s each test, $\lambda_{\text{ex}} = 470$ nm.
Fig. S5 The fluorescence spectra of probe 1 ($1 \times 10^{-5}$ M) in aqueous solutions with different ratios (H$_2$O:DMF), wait for 30s each test, $\lambda_{ex} = 470$ nm.

Fig. S6 The fluorescence spectra of compound 1 ($1 \times 10^{-5}$ M) upon addition of Cr(VI) (Cr$_2$O$_7^{2-}$, $1 \times 10^{-5}$ M) in the aqueous solutions with different ratios (H$_2$O: DMF), wait for 30s each test, $\lambda_{ex} = 470$ nm.
Fig. S7 The fluorescence spectra of compound 1 (1 x 10^{-5} M) upon addition of Cr_2O_7^{2-} (0, 0.1, 0.2, 0.3, 0.4, 0.5, 0.6, 0.7, 0.8, 0.9, 1.0, 1.2, 1.5, 2.0, 2.5, 3.0, 3.5, 4.0, 4.5, 5.0 equiv) in H_2O: DMF (3:7, v:v), wait for 30s each test, \( \lambda_{ex} = 470 \text{ nm} \). Inset: The linear relationship of fluorescence titration.
**Fig. S8** The pH-titration of free 1 (1 μM, red) and 1+ Cr$_2$O$_7^{2-}$ (5 μM, yellow) in H$_2$O: DMF (3:7, v:v) solution. The pH values of the solution were adjusted by very small amount of HCl and KOH aqueous solution. Wait for 30s each test, $\lambda_{ex} = 470$ nm.

**Fig. S9** Fluorescence responses of probe 1 (1 $\times$ 10$^{-5}$ M) to various anions in H$_2$O: DMF (3:7, v:v), black bars represent addition of different anions (5 equiv.) to the solution. Blue bars represent the change of the emission that occurs upon the subsequent addition of Cr(VI) (5 equiv) to the above solutions. wait for 30s each test, $\lambda_{ex} = 470$ nm.
Fig. S10 Fluorescence responses of probe 1 (1 × 10⁻⁵ M) to various cations in H₂O: DMF (3:7, v:v), black bars represent addition of different cations (5 equiv.) to the solution. Blue bars represent the change of the emission that occurs upon the subsequent addition of Cr(VI) (5 equiv) to the above solutions. wait for 30s each test, λₑₓ = 470 nm.

Fig. S11 The UV titration diagram of probe 1 (1×10⁻⁵ M) upon addition of Cr(VI) (Cr₂O₇²⁻ , 0 to 20 equiv) in H₂O: DMF (3:7, v:v) solution.
Fig. S12 (a, c) Color and (b, d) fluorescent (365 nm lamp) change of 1 (1 x 10^-5 M) to various anions (Na₂C₂O₄, Mg(ClO₄)₂, Na₃SO₃, NaClO, NaF, NaBr, NaHSO₄, Na₂SO₄, K₂Cr₂O₇, AgNO₃, NaCl, NaHCO₃, Na₂CO₃, Na₂S, NaNO₂, NaI, K₃PO₄, NaOAc, 1 x 10^-5 M) in H₂O: DMF (3:7, v:v) solution.
Fig. S13 (a, c) Color and (b, d) fluorescent (365 nm lamp) change of I ($1 \times 10^{-5}$ M) to various cations and H$_2$O$_2$ (blank, LiCl, NaCl, KCl, MgSO$_4$, CaCl$_2$, Ba(NO$_3$)$_2$, Al(NO$_3$)$_3$, Pb(NO$_3$)$_2$, Cr$_2$(SO$_4$)$_3$, KMnO$_4$, K$_2$Cr$_2$O$_7$, FeCl$_3$, Co(NO$_3$)$_2$, Ni(NO$_3$)$_2$, CuCl$_2$, AgNO$_3$, Zn(OAc)$_2$, CdCl$_2$, HgCl$_2$, (NH$_4$)$_2$Ce(NO$_3$)$_6$, and H$_2$O$_2$, $1 \times 10^{-5}$ M) in H$_2$O: DMF (3:7, v:v) solution.
