EXPERIMENTAL SECTION

The NMR experiments were performed with a 400 MHz spectrometer, and chemical shifts are expressed in parts per million with TMS as an internal reference. The mass spectra were recorded on Q-TOF instrument using electrospray ionization method. Absorption and steady state fluorescence studies were carried out with HPLC grade solvent. The elemental analyses were performed on a ThermoQuest microanalysis instrument. FT-IR spectra were measured on Perkin-Elmer spectrometer using KBr pellets. Cyclic Voltammetry studies were carried out with an electrochemical system utilizing the three electrode configuration consisting of a Glassy carbon (working electrode), platinum wire (auxillary electrode) and saturated calomel (reference electrode) electrodes. The experiments were done in dry dichloromethane using 0.1 M tetrabutylammonium perchlorate (TBAP) as supporting electrolyte. The time-resolved fluorescence decay measurements were carried out at magic angle using a picosecond diode laser based time correlated single photon counting (TCSPC) fluorescence spectrometer. For UV-vis and fluorescence titrations, the stock solution of BODIPY 2 ($5 \times 10^{-6}$ M) was prepared by using spectroscopic grade CH$_3$CN. The picric acid (PA) solution was prepared ($1 \times 10^{-2}$ M) in CH$_3$CN. The solution containing BODIPY 2 was placed in quartz cell (1 cm width), and PA solution was added in an incremental fashion. The association constant of the complex formed in solution has been estimated by using the standard Benesi–Hildebrand equation. In $^1$H NMR titration, solution of BODIPY 2 in 0.4 mL of CD$_3$CN/D$_2$O (97.5/2.50; v/v) was prepared ($5 \times 10^{-3}$ M), and a 0.4 mL portion of this solution was transferred to a 5-mm NMR tube. A small aliquot of PA in CD$_3$CN was added in an incremental fashion, and their corresponding spectra were recorded.
Synthesis and Characterization for 3,5-bis(acetal) BODIPY 2: 3,5-diformyl-boron dipyrrromethene 1 (100 mg, 0.295 mmol) in dry methanol (15 mL) was warmed until some parts of the solids were dissolved, giving a bright yellow suspension. Neat TFA (0.589 mmol) was added dropwise, causing the entire residual solid dissolve and yield a violet color solution. The mixture was stirred for 1 hr, and then TEA was added slowly in dropwise and continued stirring at room temperature for additional 30 min. The reaction mixture was evaporated and the crude product was purified using silica gel column chromatography with petroleum ether/ethylacetate (85:15) and afforded pure 3,5-bis(acetal) BODIPY 2 as an orange solid. Yield: 78% (99 mg, 0.230 mmol). ¹H NMR (400 MHz, CDCl₃, δ in ppm): 2.46 (s, 3H; -CH₃), 3.48 (s, 12H; -OCH₃), 5.87 (s, 2H; meso-CH), 6.68-6.69 (d, ³J (H, H) = 4.24 Hz, 2H; py), 6.89-6.70 (d, ³J (H, H) = 4.20 Hz, 2H; py), 7.30-7.32 (d, ³J (H, H) = 7.96 Hz, 2H; Ar), 7.41-7.43 (d, ³J (H, H) = 7.96 Hz, 2H; Ar). ¹³C NMR (100 MHz, CDCl₃, δ in ppm): 21.6, 29.9, 54.7, 98.5, 117.6, 129.3, 130.7, 131.1, 131.4, 135.0, 141.4, 147.9, 156.7. ¹¹B NMR (128.3 MHz, CDCl₃, δ in ppm): 0.78 (t, ¹J (B-F) = 31.5 MHz, 1B). ¹⁹F NMR (376.4 MHz, CDCl₃, δ in ppm): -140.1 (q, ¹J (F-B) = 33.1 MHz, 2F). HRMS. Caled for C₂₂H₂₅BF₂N₂O₄: [(M+Na)⁺]: m/z 453.1773. Found: m/z 453.1769. Elemental analysis cald (%) for C₂₂H₂₅BF₂N₂O₄: C 61.41, H 5.86, N 6.51; found C 61.53, H 5.71, N 6.48.

Figure S14: IR spectrum of BODIPY 1
Figure S15: Changes in fluorescence spectra of BODIPY 2 (5 μM) upon titration with TFA (0 to 30 equiv.) in CH$_3$CN/H$_2$O (9:1; v/v) solution. ($\lambda_{ex} = 488$ nm).
Figure S16: (a) Fluorescence spectral traces of BODIPY 2 during titration with PA to determine LOD. (b) The linear dynamic fluorescence response for the titration of BODIPY 2 with PA to determine the detection limit (LOD). The LOD was derived by using the formula $3\sigma/K$ where $\sigma$ = standard deviation of the blank (10 blank samples) and $K$ = is the slope of linear calibration curve.
